Route Reflection..........................................................................................................................................................195
  Overview...........................................................................................................................................................195
  BGP multiple cluster IDs.......................................................................................................................................................196
  Configuring multiple cluster IDs.......................................................................................................................................................196

Route Reflection Commands.......................................................................................................................................................199
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast route-reflector-client.................................................................200
  protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-reflector-client.................................................................202
  protocols bgp <asn> neighbor <id> cluster-id <cluster-id>.......................................................................................................................................................203
  protocols bgp <asn> parameters cluster-id <id>.......................................................................................................................................................204
  protocols bgp <asn> parameters no-client-to-client-reflection all.......................................................................................................................................................205
  protocols bgp <asn> parameters no-client-to-client-reflection cluster-id any.......................................................................................................................................................206
  protocols bgp <asn> parameters no-client-to-client-reflection cluster-id <cluster-id>.................................................................207
  protocols bgp <asn> peer-group <group-name> address-family ipv4-unicast route-reflector-client.................................................................208
  protocols bgp <asn> peer-group <group-name> address-family ipv6-unicast route-reflector-client.................................................................209
  protocols bgp <asn> peer-group <group-name> cluster-id <cluster-id>.......................................................................................................................................................210

Confederations Commands.......................................................................................................................................................211
  protocols bgp <asn> parameters confederation identifier <asn>.......................................................................................................................................................212
  protocols bgp <asn> parameters confederation peers <asn>.......................................................................................................................................................213

Synchronization..........................................................................................................................................................215
  Basic synchronization configuration.......................................................................................................................................................215
  Verifying the configuration.......................................................................................................................................................218
  Graceful restart..........................................................................................................................................................221

Neighbors Commands.......................................................................................................................................................223
  protocols bgp <asn> neighbor <id>.......................................................................................................................................................225
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast.......................................................................................................................................................226
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast allowas-in number <number>.................................................................227
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast attribute-unchanged <action>.................................................................229
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast capability graceful-restart.................................................................231
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast capability orf prefix-list <state>.................................................................232
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast default-originate route-map <map-name>.................................................................234
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast disable-send-community <state>.................................................................236
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast distribute-list export acl-number.................................................................238
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast distribute-list import acl-number.................................................................240
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast filter-list export as-path-list-name.................................................................242
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast filter-list import as-path-list-name.................................................................243
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast maximum-prefix <max-number>.................................................................244
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast next-hop-self.......................................................................................................................................................246
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast peer-group <group-name>.................................................................247
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast prefix-list export <list-name>.................................................................248
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast prefix-list import <list-name>.................................................................249
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast remove-private-as.................................................................250
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast route-map export <map-name>.................................................................252
  protocols bgp <asn> neighbor <id> address-family ipv4-unicast route-map import <map-name>.................................................................254
protocols bgp <asn> neighbor <id> address-family ipv4-unicast soft-reconfiguration inbound................................. 256
protocols bgp <asn> neighbor <id> address-family ipv4-unicast unsuppress-map <map-name>.............................. 258
protocols bgp <asn> neighbor <id> address-family ipv4-unicast weight <weight>......................................................... 259
protocols bgp <asn> neighbor <id> address-family ipv6-unicast.................................................................................. 260
protocols bgp <asn> neighbor <id> address-family ipv6-unicast allowas-in.............................................................. 261
protocols bgp <asn> neighbor <id> address-family ipv6-unicast capability graceful-restart................................. 265
protocols bgp <asn> neighbor <id> address-family ipv6-unicast capability orf............................................................... 266
protocols bgp <asn> neighbor <id> address-family ipv6-unicast default-originate.................................................... 268
protocols bgp <asn> neighbor <id> address-family ipv6-unicast disable-send-community <state>............................ 270
protocols bgp <asn> neighbor <id> address-family ipv6-unicast distribute-list export <access-list6-name>............. 272
protocols bgp <asn> neighbor <id> address-family ipv6-unicast distribute-list import <access-list6-name>............. 273
protocols bgp <asn> neighbor <id> address-family ipv6-unicast filter-list export <as-path-list-name>.................. 274
protocols bgp <asn> neighbor <id> address-family ipv6-unicast filter-list import <as-path-list-name>.................. 275
protocols bgp <asn> neighbor <id> address-family ipv6-unicast maximum-prefix <max-number>......................... 276
protocols bgp <asn> neighbor <id> address-family ipv6-unicast nexthop-self.............................................................. 278
protocols bgp <asn> neighbor <id> address-family ipv6-unicast peer-group <group-name>................................. 279
protocols bgp <asn> neighbor <id> address-family ipv6-unicast prefix-list export <prefix-list6-name>.............. 280
protocols bgp <asn> neighbor <id> address-family ipv6-unicast prefix-list import <prefix-list6-name>.............. 281
protocols bgp <asn> neighbor <id> address-family ipv6-unicast remove-private-as.................................................. 282
protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-map export <map-name>................................. 284
protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-map import <map-name>.......................... 285
protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-reflector-client........................................... 286
protocols bgp <asn> neighbor <id> address-family ipv6-unicast soft-reconfiguration inbound............................ 287
protocols bgp <asn> neighbor <id> address-family ipv6-unicast unsuppress-map <map-name>............................ 289
protocols bgp <asn> neighbor <id> address-family ipv6-unicast weight <weight>.................................................... 290

Document conventions

The document conventions describe text formatting conventions, command syntax conventions, and important notice formats used in Brocade technical documentation.

Text formatting conventions

Text formatting conventions such as boldface, italic, or Courier font may be used in the flow of the text to highlight specific words or phrases.

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bold text</strong></td>
<td>Identifies command names</td>
</tr>
<tr>
<td></td>
<td>Identifies keywords and operands</td>
</tr>
<tr>
<td></td>
<td>Identifies the names of user-manipulated GUI elements</td>
</tr>
<tr>
<td></td>
<td>Identifies text to enter at the GUI</td>
</tr>
<tr>
<td><em>italic text</em></td>
<td>Identifies emphasis</td>
</tr>
<tr>
<td></td>
<td>Identifies variables</td>
</tr>
<tr>
<td></td>
<td>Identifies document titles</td>
</tr>
<tr>
<td><strong>Courier font</strong></td>
<td>Identifies CLI output</td>
</tr>
<tr>
<td></td>
<td>Identifies command syntax examples</td>
</tr>
</tbody>
</table>

Command syntax conventions

Bold and italic text identify command syntax components. Delimiters and operators define groupings of parameters and their logical relationships.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bold text</strong></td>
<td>Identifies command names, keywords, and command options.</td>
</tr>
<tr>
<td><em>italic text</em></td>
<td>Identifies a variable.</td>
</tr>
<tr>
<td>value</td>
<td>In Fibre Channel products, a fixed value provided as input to a command option is printed in plain text, for example, --show WWN.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Syntax components displayed within square brackets are optional.</td>
</tr>
<tr>
<td>{ x</td>
<td>y</td>
</tr>
<tr>
<td></td>
<td>In Fibre Channel products, square brackets may be used instead for this purpose.</td>
</tr>
<tr>
<td>x</td>
<td>y</td>
</tr>
<tr>
<td>&lt; &gt;</td>
<td>Nonprinting characters, for example, passwords, are enclosed in angle brackets.</td>
</tr>
</tbody>
</table>
Notes, cautions, and warnings

Notes, cautions, and warning statements may be used in this document. They are listed in the order of increasing severity of potential hazards.

NOTE
A Note provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

ATTENTION
An Attention statement indicates a stronger note, for example, to alert you when traffic might be interrupted or the device might reboot.

CAUTION
A Caution statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

DANGER
A Danger statement indicates conditions or situations that can be potentially lethal or extremely hazardous to you. Safety labels are also attached directly to products to warn of these conditions or situations.

Brocade resources

Visit the Brocade website to locate related documentation for your product and additional Brocade resources.

You can download additional publications supporting your product at www.brocade.com. Select the Brocade Products tab to locate your product, then click the Brocade product name or image to open the individual product page. The user manuals are available in the resources module at the bottom of the page under the Documentation category.

To get up-to-the-minute information on Brocade products and resources, go to MyBrocade. You can register at no cost to obtain a user ID and password.

Release notes are available on MyBrocade under Product Downloads.

White papers, online demonstrations, and data sheets are available through the Brocade website.

Contacting Brocade Technical Support

As a Brocade customer, you can contact Brocade Technical Support 24x7 online, by telephone, or by e-mail. Brocade OEM customers contact their OEM/Solutions provider.

Brocade customers

For product support information and the latest information on contacting the Technical Assistance Center, go to http://www.brocade.com/services-support/index.html.

If you have purchased Brocade product support directly from Brocade, use one of the following methods to contact the Brocade Technical Assistance Center 24x7.

### Brocade OEM customers

If you have purchased Brocade product support from a Brocade OEM/Solution Provider, contact your OEM/Solution Provider for all of your product support needs.

- OEM/Solution Providers are trained and certified by Brocade to support Brocade® products.
- Brocade provides backline support for issues that cannot be resolved by the OEM/Solution Provider.
- Brocade Supplemental Support augments your existing OEM support contract, providing direct access to Brocade expertise. For more information, contact Brocade or your OEM.
- For questions regarding service levels and response times, contact your OEM/Solution Provider.

### Document feedback

To send feedback and report errors in the documentation you can use the feedback form posted with the document or you can e-mail the documentation team.

Quality is our first concern at Brocade and we have made every effort to ensure the accuracy and completeness of this document. However, if you find an error or an omission, or you think that a topic needs further development, we want to hear from you. You can provide feedback in two ways:

- Through the online feedback form in the HTML documents posted on www.brocade.com.
- By sending your feedback to documentation@brocade.com.

Provide the publication title, part number, and as much detail as possible, including the topic heading and page number if applicable, as well as your suggestions for improvement.
About This Guide

This guide describes how to configure BGP on the Brocade 5600 vRouter (referred to as a virtual router, vRouter, or router in the guide).
BGP overview

Border Gateway Protocol (BGP) is the principal inter-domain routing protocol used on the Internet. BGP version 4 is specified in RFC 4271, which obsoletes the original BGPv4 specification defined in RFC 1771.

The principal concept of BGP is that of the Autonomous System (AS). An AS is a routing domain that is under one administrative authority, and which implements its own routing policies. For example, one Internet Service Provider (ISP) would have its own AS, while another would have its own, different, AS. Many large enterprises also have their own AS, particularly if they are multi-homed (that is, connected to multiple ISPs). The BGP routing protocol is used to convey network reachability information from one AS to another.

Routers that are configured to run BGP between one another are known as BGP peers or BGP neighbors. BGP uses a TCP connection on the well-known port 179 to exchange routing information between peers. BGP peers that are configured within the same AS are referred to as internal BGP (iBGP) peers. A BGP peer that is configured in a different AS than another peer are referred to as external BGP (eBGP) peers.

There are two basic types of BGP route exchanges that occur between peers: route announcements and route withdrawals.

- A route announcement tells a peer that it can reach a particular network via the announcing router, and includes attributes associated with that path.
- A route withdrawal tells a peer that a previously announced route is no longer reachable via this peer.

All valid route announcements that are received on a BGP router are placed into the BGP table of the router. (These routes are typically referred to as BGP paths.) This means that, for a particular network prefix—for example, 10.0.0.0/8—the local BGP router might have recorded multiple available paths: one through any of its BGP peers. For each prefix, the BGP process uses a path selection algorithm to select the best available path from all those learned from its peers. Once the best path has been selected, that path becomes the candidate route from the BGP protocol for inserting into the active routing table.

Each BGP path includes several attributes that are used by the BGP path selection process to determine which path is the best available path. These attributes can also be used in user-defined routing policies applied to BGP; these can allow the router to perform additional actions on a matching path, such as determining whether to accept or reject a route announcement.

One of the most commonly used BGP path attributes is the AS path. The AS path lists each of the AS by which the prefix has been announced, and is used to prevent routing loops. The AS path is read from right to left, where the right-most AS is the AS that originated the network prefix (that is, it was the first AS to announce reachability for this prefix). This AS is known as the origin AS.

As a network prefix is advertised between AS, each AS prepends its own AS number to the AS path. For example, the AS path ‘4 3 2 1’ indicates that AS 1 originated the network prefix. The prefix was advertised from AS 1 through AS 2, then from AS 2 through AS 3, and finally from AS 3 through AS 4.

Other BGP path attributes include origin, next hop, multi-exit discriminator (‘med’), local preference (‘local pref’), atomic aggregate, and aggregator. These attributes are described in more detail in another section of this document.
iBGP and eBGP
A BGP peer can be one of two types:

- Internal BGP (iBGP) peers are peers that are configured with the same AS number.
- External BGP (eBGP) peers are peers that are configured with different AS numbers.

iBGP
The BGP protocol requires that all iBGP peers within an AS have a connection to one another, creating a full-mesh of iBGP peering connections. (The exception to this is route reflection.) When a prefix is announced from one iBGP peer to another, the AS path is not changed. Due to the full-mesh requirement, all iBGP peers should have the same view of the BGP table, unless different routing policies have been applied to some of the peers.

When a router receives an iBGP announcement, the BGP process uses the BGP best path selection algorithm to determine whether the received announcement is the best available path for that prefix. If it is the best available path, then the BGP process uses this route as the BGP candidate route for insertion into the routing table, and the BGP process announces this path to all its peers, both iBGP and eBGP peers. If it is not the best available path, then the BGP process keeps a copy of this path in its BGP table, so that it can be used to calculate the best available path when path information for that prefix changes (for example, if the current best available path is withdrawn).

The BGP ID is a unique identifier in the format of an IP address used to identify a peer. The peering IP address is the actual IP address used for the BGP connection.

For iBGP peerings, the BGP ID and peering IP is frequently the IP address bound to that router’s loopback interface. An iBGP session is usually contained within a local LAN, with multiple redundant physical links between the iBGP devices. For iBGP routes, reachability is all that is necessary, and the loopback interface is reachable so long as at least one physical interface is operational. Because of the physical and/or logical redundancy that exists between iBGP peers, iBGP peering on the loopback interface works well.

Since BGP does not provide reachability information, you must make sure that each iBGP peer knows how to reach other peers. To be able to reach one another, each peer must have some sort of Interior Gateway Protocol (IGP) route, such as a connected route, a static route, or a route through a dynamic routing protocol such as RIP or OSPF, which tells them how to reach the opposite router.

eBGP
External BGP is the method that different Autonomous Systems (ASs) use to interconnect with one another. eBGP usually takes place over WAN links, where there may be a single physical path between eBGP peers. Alternatively, they may have multiple eBGP peer connections to provide redundancy. Redundant peers use distinct BGP sessions so that, if one session fails, another can take over.

BGP uses an AS path to track the path of a prefix through the various ASs that send or receive the prefix announcement. When a prefix is announced to an eBGP peer, the local AS number is prepended to the AS path. This helps to prevent routing loops by rejecting any prefix announcements that include the local AS number in the AS path. Prefix announcements learned via eBGP are also analyzed using the BGP best path selection process.

For eBGP peerings, the BGP ID and peering IP address is typically the local IP address of the interface that is being used to connect to the eBGP peers. However, if more than one physical interface is being used for eBGP peering, it is also common to use a loopback IP address as the BGP ID, but still use the physical interface IP address as the peering IP address.

BGP ID selection process
It is best practice to configure the BGP ID explicitly by using protocols bgp <asn> parameters router-id <id> on page 148. If explicitly assigned, then this is the BGP ID that should be used. If it is not assigned explicitly, then the system choose one automatically. If a loopback address is configured as is not 127.0.0.1, it be used. If the loopback address is not used, then the largest IP address assigned to an interface in the system configuration be used.
So, best practice suggests that the following configuration commands be run on each BGP router to explicitly set the BGP ID. In this example, a loopback address of 10.0.0.11/32 is used.

### TABLE 1 Best practice for setting the BGP ID

### BGP path selection process

The BGP process may receive advertisements from multiple peers for the same network prefix. Each of these announcements from a peer for a prefix is called a path. The BGP process selects the 'best' path from all available paths and this path becomes the candidate route announced by BGP for inclusion in the Routing Information Base (RIB).

Depending on what other protocols also have candidate routes for this network prefix, the BGP route may or may not be added to the RIB. For instance if the RIB has candidate routes from both BGP and static routing for the same prefix, the static route, not the BGP route, be included in the RIB. This is because the static route process has a lower administrative cost than the BGP process.

It is important to note that BGP does not consider paths that contain a NEXT_HOP value that is not reachable via an entry in the RIB. For all valid paths, the Brocade vRouter uses a BGP path selection process based on decision process described in RFC 4271, section 9.1 and RFC 5004. BGP paths are preferred based on the following:

- **LOCAL PREFERENCE**: Prefer the path with the highest LOCAL_PREF.
- **AS PATH LENGTH**: Prefer the path with the shortest AS_PATH.
- **ORIGIN**: Prefer the path with the lowest ORIGIN type.
- **MULTI_EXIT_DISC**: Prefer the path with the lowest MED.
- **PEER TYPE**: Prefer the paths learned via eBGP over paths learned via iBGP.
- **IGP METRIC**: Prefer the paths with lower IGP metric for the path's NEXT_HOP address.
- **BGP ID**: Prefer the path with the lowest BGP ID.
- **PEER IP**: Prefer the path with the lowest peer IP address.

The best path selection process is performed as ‘first match and out.’ This means that two paths be compared until the first difference in preference criteria. For example, two paths for the same network prefix may have the same LOCAL_PREF value, but different AS path...
lengths. In this case, the path with the shortest AS path would be the "best" path. If the peer IP address is being used to select the best path, this means that all other path criteria were the same for the available paths.

You can use `show ip bgp` on page 162 to see the current best paths in the RIB.

**Scalability of BGP**

The Border Gateway Protocol 4 specification (RFC 4271) requires that iBGP peers be fully meshed; that is, every iBGP peer must have a connection to every other iBGP peer. A full mesh of iBGP peers does not scale well to large AS, which can have hundreds of iBGP routers. To scale well in a large AS, two enhancements have been developed for BGP:

- BGP Confederations (RFC 3065)
- Route Reflection (RFC 2796)

**Confederations**

Confederations enable you to reduce the size and complexity of the iBGP mesh. In a BGP confederation, a single AS is divided into multiple internal sub-AS to help keep the number of iBGP peer connections manageable. Each sub-AS is assigned its own AS number; this is typically assigned from the private AS number space, which ranges from 64512 through 65534. Within a sub-AS, all the standard iBGP rules, including full-mesh peering, apply. The connections between confederation sub-AS use eBGP peering. One or more eBGP connections can be made between each sub-AS. The sub-AS are grouped as a confederation, which advertises as a single AS to external peers.

The following figure shows the large number of iBGP connections that must be configured in even a moderately sized AS. In this example, 14 routers are participating in iBGP.

**FIGURE 1 iBGP full mesh**
The following figure shows a BGP confederation that splits the single AS shown in the preceding figure into three sub-AS, which each use private AS numbers. Within each sub-AS, all of the iBGP peers are fully meshed. The sub-AS are connected to one another using an eBGP connection.

**FIGURE 2 BGP confederation**

---

**Route reflection**

Another technology designed to help ASs with large numbers of iBGP peers is route reflection. In a standard BGP implementation, all iBGP peers must be fully meshed, because of this requirement, when an iBGP peer learns a route from another iBGP peer, the receiving router does not forward the route to any of its iBGP peers, since these routers should have learned the route directly from the announcing router.

In a route reflector environment the iBGP peers are no longer fully meshed. Instead, each iBGP peer has an iBGP connection to one or more route reflectors (RRs). Routers configured with a connection to an RR server are referred to as RR clients. Only the RR server is configured to be aware that the RR client is part of an RR configuration; from the RR client’s point of view, it is configured normally, and does not have any awareness that it is part of a RR configuration.

In route reflection, internal peers of an RR server are categorized into two types:

- **Client peers:** The RR server and its client peers form a cluster. Within a cluster, client peers need not be fully meshed, but must have an iBGP connection to at least one RR in the cluster.
- **Non-client peers:** Non-client peers, including the RR server, must be fully meshed.

An RR environment is unlike a regular environment, where iBGP peers never forward a route update to other iBGP peers (which is the reason why each iBGP peer must peer with all other peers). When an RR server receives an iBGP update from an RR client, these route updates can also be sent to all other RR clients. When an RR server receives a route update from a peer, it selects the best path based on its path selection rule. After the best path is selected, the RR server chooses its action depending on the type of the peer from which it learned the best path.
• If the route was learned from a client peer, the RR reflects the route to both client and non-client peers. All iBGP updates from client peers are reflected to all other client peers in the cluster. This is done regardless of whether the update was the best path for the RR itself.
• If the route was learned from a non-client iBGP peer, it is reflected out to all RR client peers.
• If the route was learned from an eBGP peer, the route is reflected to all RR clients and all non-clients.

The following figure shows again the full mesh of iBGP connections in even a moderately sized AS.

FIGURE 3 iBGP full mesh

The following figure shows how introducing route reflection into the AS dramatically reduces the number of iBGP connections required within the AS.
Note that to prevent looping, clients must not peer with RRs outside of the cluster.

To achieve redundancy, more than one RR server can be configured within a cluster. Also, to scale to very large networks, a large AS can be configured to have multiple clusters with redundant RR servers, where the RR servers are all configured with a full mesh of iBGP connections between the RR servers.

**Route flapping and flap damping**

Route flapping is a situation where a route fluctuates repeatedly between being announced, then withdrawn, then announced, then withdrawn, and so on. In this situation, a BGP system will send an excessive number of update messages advertising network reachability information.

Route flapping can cause several different issues. First, each time a new route is learned or withdrawn the BGP best path selection process for that prefix must be executed, which can result in high CPU utilization. If a large enough number of routes are flapping, the BGP process may not be able to converge sufficiently quickly. Second, the route flapping issue can become amplified as it passes from peer to peer. For example, if a router with two peers flaps a route, and those two peers each have 10 peers, the flapping route affects 20 BGP routers.

Route damping is intended to minimize the propagation of update messages between BGP peers for flapping routes. This reduces the load on these devices without unduly impacting the route convergence time for stable routes.

When route damping is enabled, a route is assigned a penalty each time it “flaps” (that is, each time it is announced and then withdrawn within a short interval). If the penalty exceeds 1000 (its suppress value) the route is suppressed.
After the route has been stable for a configured interval (its half-life) the penalty is reduced by half. Subsequently, the penalty is reduced every five seconds. When the penalty falls below a configured value (its reuse value), the route is unsuppressed.

The penalty applied to a route will never exceed the maximum penalty, which is computed from configured attributes as follows:

\[
\text{Maximum penalty} = \text{reuse} \times 2^{(\text{max-suppress-time} / \text{half-life})}
\]

While the route is being “damped,” updates and withdrawals for this route from a peer are ignored. This helps to localize the route flapping to a particular peering connection.

**AS paths**

An AS path is a path to a destination in the Border Gateway Protocol (BGP). The path is represented as a sequence of AS numbers, which are the numbers uniquely identifying BGP AS. Each AS number represents an AS (which may be comprised of multiple networks) that a packet traverses if it takes the associated route to the destination.

For a packet to reach a destination using this route, it traverses the listed AS from the leftmost AS number to the rightmost, where the rightmost is the AS immediately preceding its destination.

Using policies, match conditions can be defined based on all or portions of the AS path. To do this, you can either specify the AS path directly in a policy command using a regular expression in the `as-path` attribute, or create a named AS path regular expression using the `as-path-list` attribute and including the name in a policy command.

**BGP communities**

All BGP updates include a BGP attribute called the communities path attribute. The communities path attribute allows ASs to “tag” prefix announcements. This tag can then be used by routing policies to modify the normal behavior for that prefix announcement. For example, an AS could choose to filter out all prefix announcements containing a community value that identifies the prefix as a customer-generated prefix, instead only announcing the summary prefix for all customer prefixes. It is important to note that the community path attribute is carried in BGP update messages, which allows ASs not directly connected to each other to share information about a prefix.

The format for community identifiers is defined in RFC 1997: “BGP Communities Attribute.” The community identifier is a 32-bit value, where the first two bytes of the value are the AS number and the second two bytes are an arbitrary value defined by the AS. This format can be represented as \(AA:NN\), where \(AA\) is the AS number of the AS adding the community identifier to the community path attribute, and \(NN\) represents a user-defined policy value.

There are two types of BGP communities:

- well-known communities
- user-defined or private communities

The Brocade vRouter recognizes the following BGP well-known communities as per RFC 1997:

- **NO_EXPORT**: Allows a BGP speaker to specify that redistribution should extend only to the neighbouring AS. All routes received carrying a communities attribute containing this value are not advertised outside a BGP confederation boundary (a stand-alone autonomous system that is not part of a confederation should be considered a confederation itself).
- **NO_ADVERTISE**: All routes received carrying a communities attribute containing this value are not advertised to other BGP peers.
- **LOCAL_AS**: All routes received carrying a communities attribute containing this value are not advertised to other BGP peers.

In addition, the Brocade vRouter recognizes the INTERNET community. The INTERNET community is not, strictly speaking, a well-known community. (It is not, for example, mentioned in RFC 1997.) You can use the INTERNET community when you would use a “permit all” statement, for example, at the end of a community list. (Like access lists, community lists have an implicit “deny all” statement.
at their end.) The “permit INTERNET” statement is equivalent to the “permit any” statement, matching any community in the IP community list.

BGP community list is a user defined BGP communities attribute list. BGP community list can be used for matching or manipulating BGP communities attribute in updates.

The Brocade vRouter also supports the following user-defined community lists:

- Standard
- Extended

Furthermore, standard and extended community lists support standard and expanded lists. A standard community list ranges from 1 through 99 and an expanded community list ranges from 100 through 199.

Standard Community List

- Standard list specifies standard community attributes.
- Expanded list specifies regular expression.

Extended Community List

- Standard list specifies route-target and site-of-origin.
- Expanded list specifies regular expression.

NOTE
Community lists do not support these features: named community list and appending of a community list on a received prefix with new communities.

Peer groups

In order to simplify the configuration of multiple similar peer sessions, “peer groups” are available. Configuring a peer group is the same as configuring an individual BGP peer. The peer group configuration applies to all members of the peer group.

NOTE
A peer group can have a maximum of 32 BGP peers.

A neighbor can be associated with a single peer group although it can selectively inherit the properties of the given peer group per address family.

Depending on the IP address family type of the peer group, peers are added to a peer group by using protocols bgp <asn> neighbor <id> address-family ipv4-unicast peer-group <group-name> on page 247 or protocols bgp <asn> neighbor <id> address-family ipv6-unicast peer-group <group-name> on page 279.

If the neighbor is associated under an IPv4 address family and an IPv6 address family by using protocols bgp <asn> neighbor <id> address-family ipv4-unicast peer-group <group-name> on page 247 and protocols bgp <asn> neighbor <id> address-family ipv6-unicast peer-group <group-name> on page 279, then all of the following applies:

- Global or address-family agnostic configurations of the peer group are applied to the neighbor.
- IPv4 address-family specific configurations of the peer group are applied to the neighbor.
- IPv6 address-family specific configurations of the peer group are applied to the neighbor.

If the neighbor is associated under an IPv4 address family and not an IPv6 address family (using protocols bgp <asn> neighbor <id> address-family ipv4-unicast peer-group <group-name> on page 247), then the following applies:

- Global or address-family agnostic configurations of the peer group are applied to the neighbor and IPv4 address-family specific configurations of the peer group are applied to the neighbor.
- The IPv6 address-family specific configurations of the peer group are not applied to the neighbor.
If the neighbor is associated under an IPv6 address family and not an IPv4 address family (using `protocols bgp <asn> neighbor <id> address-family ipv6-unicast peer-group <group-name>` on page 279), then the following applies:

- Global or address-family agnostic configurations of the peer group are applied to the neighbor and IPv6 address-family specific configurations of the peer group are applied to the neighbor.
- The IPv4 address-family specific configurations of the peer group are not applied to the neighbor.

**BGP multipath support**

In general, BGP selects a single best path to a given destination. BGP multipath support allows multiple paths to a given destination. Having multiple paths to the same destination enables the traffic load to be shared across the multiple paths, and makes use of network resources that might normally be used only as backup.

The BGP multipath feature does not affect the BGP path selection process. Instead, the best path as well as the additional multipaths are all added to the routing table.

For more information on configuring BGP multipath support, see `protocols bgp <asn> parameters maximum-paths ebgp <max-paths>` on page 141 and `protocols bgp <asn> parameters maximum-paths ibgp <max-paths>` on page 143.

**IPv4 and IPv6 support**

The BGP implementation supports the following:

- Peering sessions between IPv4 peers
- Peering sessions between IPv6 peers
- IPv4 routing information can be carried over either IPv4 or IPv6 peering sessions
- IPv6 routing information can be carried over either IPv4 or IPv6 peering sessions
- Both IPv4 and IPv6 routing information can be carried over a single IPv4 or IPv6 peering session

**NOTE**

IPv4 routes over IPv6 sessions and IPv6 routes over IPv4 sessions cannot currently be seen via `show` commands.

IPv4 routes can be exchanged after you have enabled either of the following:

- IPv4 unicast address family for a neighbor (using `protocols bgp <asn> neighbor <id> address-family ipv4-unicast` on page 226)
- IPv4 unicast address family for the peer group to which the neighbor belongs (using `protocols bgp <asn> peer-group <name> address-family ipv4-unicast` on page 341)

IPv6 routes can be exchanged after you have enabled either of the following:

- IPv6 unicast address family for a neighbor (using `protocols bgp <asn> neighbor <id> address-family ipv6-unicast` on page 260)
- IPv6 unicast address family for the peer group to which the neighbor belongs (using `protocols bgp <asn> peer-group <name> address-family ipv6-unicast` on page 373)

The top-level address family configuration sets family-specific parameters while the neighbor-level family configuration sets support for the given family over that neighbor connection.

The following example defines IPv4 address family parameters, but does not enable any BGP neighbor connection to carry IPv4 address-family routing data.

```plaintext
bgp 7777 {
    address-family {
        ipv4-unicast {
            .......
        }
    }
}
The following example defines two BGP neighbors, one with an IPv4 address and one with an IPv6 address, that can carry both IPv4 and IPv6 routing information. Note that IPv4 address family support is implicitly defined.

```bash
bgp 7777 {
    neighbor 3ffe::c5:5 {
        address-family {
            ipv6-unicast {
            }
        }
        remote-as 7777
    }
    neighbor 10.1.1.1 {
        address-family {
            ipv6-unicast {
            }
        }
        remote-as 7777
    }
}
```

### Supported standards

The Vyatta - A Brocade Company implementation of BGP complies with the following standards:

- RFC 4271: A Border Gateway Protocol (BGP-4)
- RFC 4273: Definitions of Managed Objects for BGP-4
- RFC 2842: Capabilities Advertisement with BGP-4
- RFC 4760: Multiprotocol Extensions for BGP-4
- RFC 1997: BGP Communities Attribute
- RFC 3065: Autonomous System Confederations for BGP
- RFC 2796: BGP Route Reflection - An Alternative to Full Mesh IBGP

### Configuring BGP

This section presents sample configurations for BGP.

#### Basic iBGP configuration

In this section, you configure iBGP on the routers labeled R1, R2, R3, and R4 in the reference network diagram. Each router has an iBGP peering connection to each of the other iBGP routers in the network, satisfying the full mesh iBGP peering requirement.

In the example, the iBGP peering connections are established between iBGP neighbors using the loopback interface IP addresses. This is typical practice, particularly when there are redundant connections between the iBGP routers.

In order for the routers to be able to reach each other using the loopback IP address, the loopback IP addresses must be reachable via an entry in the routing table of the router. This requires some form of Internal Gateway Protocol (IGP). In the example here, we use a basic Open Shortest Path First (OSPF) configuration to announce the loopback addresses between neighbors.

The following figure shows the BGP connections after you have completed the iBGP configuration.
This example assumes that you have already configured the router interfaces; only the steps required to implement BGP are shown.

To create a basic iBGP configuration, perform the following steps in configuration mode.

**TABLE 2 Basic iBGP configuration**

<table>
<thead>
<tr>
<th>Router</th>
<th>Step</th>
<th>Commands</th>

</tbody>
</table>

Total number of neighbors 3
vyatta@R1:~$

The most important fields in the output for show ip bgp summary are the Up/Down and State fields. All the iBGP peers for R1 show times in the Up/Down field, which means the connection has been “established” for that period of time. The established state indicates that the peers have successfully created a BGP connection between one another, and are now able to send and receive BGP update messages.

If a peer shows in either Active or Idle in the State field, it means there is some issue that is keeping the BGP peers from forming an adjacency.

- The Active state identifies that the local router is actively trying to establish a TCP connection to the remote peer. You may see this if the local peer has been configured, but the remote peer is unreachable or has not been configured.
- The Idle state indicates that the local router has not allocated any resources for that peer connection, so any incoming connection requests be refused.

R1: show ip bgp
Because we have not configured any routing announcements yet, the BGP table is currently empty. This can be seen by the output of show ip bgp for R1, which is shown in the following example.

vyatta@R1:~$ show ip bgp
No BGP network exists
vyatta@R1:~$

Basic eBGP configuration
In this section, you configure eBGP on the routers labeled R1 and R4 in the reference network diagram. Router R1 is peering with an eBGP neighbor that is configured to be in AS 200 and router R4 is peering with an eBGP neighbor in AS 300.

In this example, the eBGP peering connections are established between eBGP neighbors using the physical interface IP addresses. This is a common configuration for eBGP peers. If the link between the peers goes down, the peering relationship should also go down since there is no redundancy.

After the basic eBGP configuration has been completed, the network should look as shown in the following figure.
This example assumes the following:
- The configuration in the preceding example has already been performed.
- The eBGP peers connecting to R1 and R4 have been properly configured for BGP.

To create a basic eBGP configuration, perform the following steps in configuration mode.

**TABLE 3 Basic eBGP configuration**

<table>
<thead>
<tr>
<th>Router</th>
<th>Step</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>R1</td>
<td>Create an eBGP peer for R1. The peer is an eBGP peer because it resides in a different AS than this router.</td>
<td>vyatta@R1# set protocols bgp neighbor 88.88.88.2 remote-as 200</td>
</tr>
<tr>

</tr>
<tr>
<td>R4</td>
<td>Activate the neighbor for the IPv4 unicast address family to enable the exchange IPv4 unicast routes.</td>
<td>vyatta@R4# set protocols bgp 100 neighbor 99.99.99.2 address-family ipv4-unicast</td>
</tr>
<tr>
<td>R4</td>
<td>Commit the configuration.</td>
<td>vyatta@R4# commit</td>
</tr>
</tbody>
</table>
Verifying the eBGP configuration

The following commands can be used to verify the eBGP configuration. Note that the output shown for these commands would be obtained after the configuration for both router R1 and router R4 has been completed.

R1: show ip bgp summary
The following example shows the output of the `show ip bgp summary` command for router R1 at this stage of the configuration.

```
vyatta@R1:~$ show ip bgp summary
BGP router identifier 10.0.0.11, local AS number 100
RIB entries 23, using 1472 bytes of memory
Peers 4, using 10080 bytes of memory

Neighbor    V    AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.0.0.22    4   100      40      44        0    0    0 00:38:23        0
10.0.0.33    4   100      40      44        0    0    0 00:38:22        0
10.0.0.44    4   100      43      47        0    0    0 00:38:22        0
88.88.88.2   4   200       4       5        0    0    0 00:01:22        0

Total number of neighbors 4
```

After adding the eBGP peer 88.88.88.2 (the BGP ID configured for the router connected to AS 200) to R1 we can see that the connection to the new peer is established (in the Up/Down field). This indicates that the peer was properly preconfigured for this connection.

Additionally, you may notice that the MsgRcvd and MsgSent fields for peer 88.88.88.2 shows “4” and “5” respectively. This shows that R1 has received four BGP messages from 88.88.88.2 and sent it five, which are associated with the connection to the peer (the `show ip bgp neighbors` command can be used to provide additional detail). Also, you can see that router R1 has received no route prefixes (PfxRcd column) from either 10.0.0.44 or from 88.88.88.2. This indicates that, though the BGP neighbors are communicating, they are not sending any prefixes. This is the way is should be at this point in the example as we have not yet configured routing announcements on any of the BGP peers.

R1: show ip bgp
Again, because we have not configured any routing announcements, the BGP table is currently empty. This can be seen by the output of `show ip bgp` for R1, which is shown in the following example.

```
vyyatta@R1:~$ show ip bgp
No BGP network exists
```

Originating a route to eBGP neighbors
One of the main requirements for BGP configurations is to originate network prefixes to BGP peers. On the Brocade vRouter this is accomplished using the network option within the BGP configuration.

In this section, you originate the network prefix from both the R1 and R4 routers. This is shown in the following figure.

**NOTE**

We assume that the routers in AS200 and AS300 are configured appropriately as eBGP peers and have routes to advertise as well.

**NOTE**

The example in this section assumes that the desired network to originate to our BGP peers is 172.16.0.0/24, which is a private RFC 1918 network address. Typically, the router would be originating a public IP network assigned by an Internet routing registry such as the American Registry for Internet Numbers (ARIN).
This example assumes that the configurations in previous sections have been performed.

To originate a route to eBGP neighbors, perform the following steps in configuration mode.

### TABLE 4 Originating routes to eBGP neighbors

Verifying the route origination

The following commands can be used to verify the route origination configuration.

R1: show ip bgp summary

The following example shows the output of the show ip bgp summary command for router R1 at this stage of the configuration. The MsgSent column indicates that the router has been sending BGP messages, showing the number of BGP messages that have been sent to each peer.

Additionally, you may notice that the `MsgRcvd` and `MsgSent` fields for peer 88.88.88.2 shows "4" and "5" respectively. This shows that R1 has received four BGP messages from 88.88.88.2 and sent it five, which are associated with the connection to the peer (the show ip bgp neighbors command can be used to provide additional detail). Also, you can see that router R1 has received seven route prefixes (PfxRcd column) from 10.0.0.44 and five route prefixes from 88.88.88.2. The prefixes received can be seen using the show ip bgp command as follows.

R1: show ip bgp

The following example shows the output of the show ip bgp command for router R1 at this stage of the configuration.

</table>
From this output we can see that R1 knows about twelve prefixes within BGP, five from AS200 and seven from AS300.

There are two symbols that are displayed at the beginning of each of the prefixes shown in the output of show ip bgp. The first symbol is the status code for a valid route, which is an asterisk (“*”). Essentially, all routes shown in the BGP table should be preceded by this symbol. The second symbol is the greater than character (“>”), which indicates which path is the best available path as determined by the BGP best path selection process. The show ip bgp command shows only the best path to each peer.

**R1: show ip route bgp**

The following example shows the output of the show ip route bgp command for router R1 at this stage of the configuration.

```
vyatta@R1:~$ show ip route bgp
B       10.0.0.0/8 [200/0] via 99.99.99.2, 00:12:04
B    *> 12.0.0.0/8 [20/0] via 88.88.88.2, dp0p161p1, 00:17:51
B    *> 172.16.0.0/12 [200/0] via 99.99.99.2 (recursive via 172.16.0.4 ), 00:12:04
B       172.16.0.0/24 [200/0] via 10.0.0.44, 00:18:37
B    *> 192.168.0.0/16 [200/0] via 99.99.99.2 (recursive via 172.16.0.4 ), 00:12:04
```

The show ip route bgp command displays the routes in the RIB that were learned via BGP. This is different from the output of show ip bgp, which shows all paths learned via BGP regardless of whether it is the best BGP path and whether the BGP candidate to the RIB for the prefix is the best route (for example, it has the lowest admin cost).

The output for the same operational BGP commands run on router R4 yields similar results.

**R4: show ip bgp summary**

The following example shows the output of the show ip bgp summary command for router R4 at this stage of the configuration.

```
vyatta@R4:~$ show ip bgp summary

```
Router R4’s BGP table contains the paths it learned from its eBGP peer, as well as the paths it learned from its iBGP neighbor R1.

### Inbound route filtering

A common requirement for BGP configurations is to filter inbound routing announcements from a BGP peer. On the Brocade vRouter this is accomplished using routing policies that are then applied to the BGP process as “import” policies. In this instance we use prefix lists in conjunction with route maps to accomplish this.

The following table creates the following inbound filtering policies:

- R1 should only accept network 12.0.0.0/8 from its eBGP peer, and reject everything else.
- R4 should allow all Internet routes, but reject all RFC 1918 networks from its eBGP peer.

This import policy is shown in the following figure.

#### NOTE

We assume that the routers in AS100 have been configured for iBGP and eBGP as shown and that the routers in AS200 and AS300 are configured appropriately as eBGP peers.

### FIGURE 8 Filtering inbound routes

To create this inbound route filter, perform the following steps in configuration mode.

Total number of prefixes 1
Outbound route filtering

Filtering outbound prefixes is another common BGP configuration requirement. On the Brocade vRouter this is accomplished using routing policies that are then applied to the BGP process as “export” policies.

The example in this section assumes that AS100 does not want to be a transit AS for AS 200 or AS 300. This means that:

- eBGP routes from R1’s eBGP peer (AS 200) should not be sent to R4’s eBGP peer.
- Routes from R4’s eBGP peer (AS 300) should not be sent to R1’s eBGP peer.

If we did not implement this filtering, AS 300 might send traffic destined for AS 200 to router R4, and this traffic would then be carried across the AS 100 network.

There are several ways that this routing policy could be implemented: two most common are basing the filter on the network prefix or basing it on the AS Path. In this example, we update the existing BGP export policy to add some additional restrictions that will prevent AS 100 from acting as a transit network for AS 200 and AS 300.

This export policy is shown in the following figure.

**NOTE**
We assume that the routers in AS100 have been configured for iBGP and eBGP as shown and that the routers in AS200 and AS300 are configured appropriately as eBGP peers.

To create this export policy, perform the following steps in configuration mode.

**TABLE 6 Creating an export policy**

<table>
<thead>
<tr>

Display the BGP configuration for eBGP neighbor 99.99.99.2.

```bash
vyatta@R4# show protocols bgp
100 neighbor 99.99.99.2
   address-family {
     ipv4-unicast {
       route-map {
         import eBGP-IMPORT
       }
       soft-reconfiguration {
         inbound
       }
       ipv6-unicast {
       }
       ebgp-multihop 1
       remote-as 300
     }
   }
```

**Verifying the outbound filter**

The following commands can be used to verify the outbound filter configuration.

**AS 200: show ip bgp**

The following example shows AS 200’s BGP table before the export filter is applied.

```bash
vyatta@AS200:~$ show ip bgp

Confederations
Confederations allow large AS to sub-divide the AS into sub-AS. This helps solve the scalability issues associated with having to maintain a full mesh of iBGP connections between all iBGP routers in the AS. In the confederation example shown in the following figure, routers R1 and R3 are configured in one sub-AS (AS number 65031) and routers R2 and R4 are configured in a different sub-AS (AS number 65021).

NOTE
We assume that the routers in AS200 and AS300 are configured appropriately as eBGP peers.
This example assumes that the configurations in previous sections have been performed.

To create the confederation shown in the preceding figure, perform the following steps in configuration mode.

**TABLE 7 Creating a BGP confederation**

Route reflectors

Router reflectors are another technology designed to help BGP scale to a large AS. In a route reflector configuration there is at least one route reflector server and one or more route reflector clients. In example shown in the following figure, router R1 is the route reflector server and router R2, R3, and R4 are the route reflector clients.

NOTE
We assume that the routers in AS200 and AS300 are configured appropriately as eBGP peers.
This example assumes that the configurations in previous sections have been performed, and that interfaces and OSPF have been configured. If you are starting from a clean base system, you need not delete previous configuration.

Route redirection

Route redirection in BGP is performed by means of routing policies. For more information about routing policies, see the Brocade 5600 vRouter Routing Policies Configuration Guide.
Setting BGP MED based on the IGP metric

A multi-exit discriminator (MED) is a path attribute that the device considers during BGP best-path selection. The value of a MED informs the external neighbors about the preferred path into an autonomous system (AS) that has multiple entry points. During BGP best-path selection, the device prefers a lower MED value as compared with a higher value.

You can send a MED value which is based on the IGP metric. When you configure a MED value, based on the IGP metric for a neighbor, the MED value is copied from the IGP metric and sent to the neighbor. Copying the MED value from the IGP metric allows eBGP peers from neighboring AS to send traffic to local AS by using the shortest path. The shortest path is based on the IGP administrative domain.

However, if a route-map for a particular neighbor is already configured with set-metric, then the set-metric command takes priority and the med-out configuration is ignored. For more information about setting a MED value based on the IGP metric, see the following commands:

- protocols bgp <asn> neighbor <id> med-out igp
- protocols bgp <asn> neighbor <id> med-out igp delay-updates
- protocols bgp <asn> neighbor <id> med-out minimum-igp
- protocols bgp <asn> peer-group <name> med-out igp
- protocols bgp <asn> peer-group <name> med-out igp delay-updates
- protocols bgp <asn> peer-group <name> med-out minimum-igp

The following example illustrates the configuration of a MED value that is based on IGP cost. In the example, R1, R2, R3 are IBGP peers. R1 is connected to R2 and R3 by using OSPF protocol. They are connected in the same AS. R4 is a neighbor of AS. R4 is an eBGP neighbor for R2 and R3. The IGP metric for R2 and R1 is 30 and the IGP metric for R1 and R3 is 20.

**FIGURE 12** Configuration of MED value that is based on IGP metric
### Configuring IPv6 routing with BGP

This section presents sample configurations for dynamic IPv6 routing with BGP.

The configuration examples that follow are based on using internal BGP (iBGP) and external BGP (eBGP) to connect and achieve communication. In this example we show configuration of the nodes using dynamic IPv6 routing with iBGP and eBGP to enable R1 and R3 to communicate through R2. To achieve this, you must configure R1 and R2 as iBGP peers, then configure R2 and R3 as eBGP peers.

For information on iBGP and eBGP, see iBGP and eBGP on page 18.

For information on configuring neighbors, see Neighbors Commands on page 223.

### Configure IPv6 BGP peers

To configure an iBGP peer between R1 and R2, perform the following steps in configuration mode.
### TABLE 9 Configuring r1 and r2 as iBGP peers

<table>
<thead>
<tr>
<th>Router</th>
<th>Step</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>R1</td>
<td>Configure an iBGP peer.</td>

</tbody>
</table>
Advertise connected networks
To advertise connected networks on R1, perform the following steps in configuration mode.

**TABLE 11 Advertising connected networks on r1**

<table>
<thead>
<tr>
<th>Step</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advertise connected networks through BGP.</td>
<td>vyatta@R1# set protocols bgp 1 address-family ipv6-unicast redistribute connected</td>
</tr>
<tr>
<td>Commit the change.</td>
<td>vyatta@R1# commit</td>
</tr>
</tbody>
</table>

Confirm address-family
To confirm the address-family, use the following command in operational mode:

```bash
vyatta@R1# show protocols bgp
bgp 1 {
  neighbor 2001:db8:2::2 {
    address-family {
      ipv6-unicast {
      }
    }
    remote-as 2
  }
}
[edit]
```

Confirm BGP neighbors
To confirm BGP neighbors, use the following command in configuration mode.

```bash
vyatta@R1# run show ip bgp ipv6 unicast neighbors 20:1:1::1 received-routes
BGP table version is 6, local router ID is 180.2.2.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

<table>

Advertise IPv4 prefix for IPv6 enabled BGP peers

IPv6 enabled BGP peers that are configured with address-family ipv4-unicast should have a route-map to define the next hop for the ipv4 prefix. This example defines a route-map for IPv6 enabled BGP peers. The route-map enables the device with a physical IPv6 address to advertise an IPv4 prefix with proper ipv4 address as the next hop.
In this example Router 2 is connected to Router 4 and has IPv4 and IPv6 interfaces. The physical direct connection link is configured with IPv4 30.1.1/24 and IPv6 30:1:1::/64 addresses. Router 2 and Router 4 are configured as BGP peers by using ipv6 30:1:1::/64 address.

The network should look as shown in the figure.

Configuring symmetric routing with VRRP and BGP

In this topology, VRRP (Virtual Router Redundancy Protocol) runs on the local internal LAN network. BGP runs between the ISP and the VRRP routers. The northbound traffic from the local internal LAN network routers does not use the same path as does the southbound (incoming) traffic from the ISP network routers. This mode of routing is referred to as asymmetric routing.

**NOTE**

If you are upgrading the Brocade vRouter to the 4.0 release from any previous release, ensure that unique VRRP group IDs are used across interfaces to avoid conflicting configurations among those interfaces. Furthermore, by employing only the following command, use unique VRRP group IDs for the VRRP groups that are tracked by BGP.

```
protocols bgp as n neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id
```

VRRP groups that are not tracked do not require unique IDs within the vRouter.

This example explains how to set up symmetric routing using BGP and VRRP.
The following components of the topology are shown in the preceding figure.

- Vyatta01 and Vyatta02 are the two routers in the local internal LAN network that are running VRRP. Vyatta01 is the master router and Vyatta02 is the backup router.
- CE01 and CE02 are the ISP gateway routers that are running BGP.

Both the VRRP master and backup routers, Vyatta01 and Vyatta02, are connected to an ISP gateway router, by using BGP. This topology provides two possible outgoing and incoming paths for the traffic.

For example, the HTTP traffic passes from CE01 to the master router, Vyatta01. To make routing symmetric, the data sent from Vyatta01 must pass through CE01.

When VRRP failover occurs, the flow of northbound traffic switches to the backup router, Vyatta02 which becomes the new master router.

After the switchover, the southbound traffic coming from the ISP network to the LAN network should pass traffic through Vyatta02 to achieve symmetric routing.

BGP recognizes the multiple paths to send traffic. BGP determines the best path to send traffic by using the path selection algorithm. Modify the BGP path selection process in ISP routers by influencing the following parameters:

- Multi-exit discriminator (MED)
To enable BGP updates to ISP routers for influencing the BGP attributes perform following steps in configuration mode.

### TABLE 14 Configuring VRRP settings

</tr>
</tbody>
</table>

### Advertising IPv6 and IPv4 prefixes over IPv4 and IPv6 eBGP peers

The BGP speaker can now carry multiple network layer protocols like IPv4 and IPv6. The following configuration examples show how to advertise an IPv6 prefix over an IPv4 connection and an IPv4 prefix over an IPv6 connection.

#### Advertising an IPv6 prefix over an IPv4 eBGP peer

**FIGURE 15 Advertising an IPv6 prefix over an IPv4 eBGP peer**

The following components of the topology are shown in the preceding figure.

- R1 router with a router ID of 1.1.1.1 and R2 router with a router ID of 2.2.2.2 are two routers.
- The IPv4 unicast address of R1 router is 198.51.100.2.

### TABLE 15 Advertising an IPv6 prefix over an IPv4 eBGP peer

<table>
<thead>
<tr>
<th>Router</th>
<th>Step</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>R1</td>
<td>Activate the neighbor for the IPv6 unicast address family to enable the exchange of IPv6 unicast routes.</td>
<td>vyatta@R1# set protocols bgp 100 address-family ipv6-unicast network 2001:db8::/64</td>
</tr>
</tbody>
</table>
From the preceding configuration example, you observe the following:

- The 2001:db8::/64 prefix is configured with a network command.
- The BGP IPv4 transport session with the IPv6 unicast address family is configured.
- The 2001:db8::/64 prefix is advertised with the next hop that is assigned to the IPv4-mapped IPv6 address (::ffff:198.51.100.1) from router 1 to router 2.

**NOTE**

The forwarding next hop must be an active route. You must ensure that the forwarding next hop is an active route because the IPv4 mapped address and the IPv6-address is derived. Therefore Brocade recommends that you use a route map to set the IPv6 next hop (for example, 2001:cafe::1/64). When a route-map is used, prefix 2001:db8::/64 is advertised with nexthop 2001:cafe::1/64.

Advertising an IPv4 prefix over an IPv6 eBGP peer

**FIGURE 16** Advertising an IPv4 prefix over an IPv6 eBGP peer

The following components of the topology are shown in the preceding figure.

- R1 router with a router ID of 1.1.1.1 and R2 router with a router ID of 2.2.2.2 are two routers.
The IPv6 unicast address of R1 router is 203.0.113.0/24.

### TABLE 16 Advertising an IPv4 prefix over an IPv6 eBGP peer

<table>
<thead>
<tr>
<th>Route</th>
<th>Step</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>R2</td>
<td>Activate the neighbor for the IPv6 unicast address family to enable the exchange of IPv6 unicast routes.</td>
<td>vyatta@R1# set protocols bgp 100 address-family ipv4-unicast network 203.0.113.0/24</td>
</tr>
</tbody>
</table>
| R2    | Set the network to advertise. | vyatta@R1# set protocols bgp 100 neighbor 2001:cafe::2 address-family ipv4-unicast  
vyatta@R1# set protocols bgp 100 neighbor 2001:cafe::2 address-family ipv6-unicast |
| R2    | Set R2 in the same AS as R1. | vyatta@R1# set protocols bgp 100 neighbor 2001:cafe::2 remote-as 200 |
| R2    | Show the advertised routes. | vyatta@R1:~$ show ip bgp neighbors 2001:cafe::2 advertised-routes  
BGP table version is 1, local router ID is 1.1.1.1  
Status codes: s suppressed, d damped, h history, valid, > best, i - internal  
Origin codes: i - IGP, e - EGP, ? - incomplete  
IPv4 Unicast address family:  
Network Next Hop Metric LocPrf Weight Path  
*> 203.0.113.0 1.1.1.1 32768 i  
Total number of prefixes 1 |

From the preceding configuration example, you observe the following:

- The 203.0.113.0/24 prefix is configured with a network command.
- The BGP IPv6 transport session with the IPv4 unicast address family is configured.
- The 203.0.113.0/24 prefix is advertised with the next hop that is assigned to the router ID 1.1.1.1 from router 1 to router 2.

**NOTE**

Brocade recommends that you use a route map to set the IPv4 next hop (for example, 203.0.113.1). When a route map is used the 198.51.100.0/24 prefix is advertised with the 203.0.113.1 next hop.

**monitor protocol bgp disable**

Disables debug message generation related to the acquisition of the BGP router ID and the sending and receiving of BGP messages.

**Syntax**

```plaintext
monitor protocol bgp disable
```

**Modes**

Operational mode

**Usage Guidelines**

Use this command to disable debugging related to the acquisition of the BGP router ID and the sending and receiving of BGP messages.
monitor protocol bgp disable all
Disables all BGP debugging.

Syntax
```
monitor protocol bgp disable all
```

Modes
Operational mode

Usage Guidelines
Use this command to disable all BGP debug message generation.
monitor protocol bgp disable events
Disables debug message generation related to BGP events.

Modes
Operational mode

Usage Guidelines
Use this command to disable generation of trace-level messages related to BGP events.
**monitor protocol bgp disable filters**

Disables debug message generation related to BGP filters.

**Modes**

Operational mode

**Usage Guidelines**

Use this command to disable generation of trace-level messages related to BGP filters.
monitor protocol bgp disable fsm
Disables debug message generation related to the BGP Finite State Machine (FSM).

Syntax

```
monitor protocol bgp disable fsm
```

Modes

Operational mode

Usage Guidelines

Use this command to disable generation of trace-level messages related to the BGP finite state machine (FSM).

A BGP router uses an FSM consisting of six states, as defined by RFC 1771. The FSM describes how and when the BGP router should make decisions about its operations with other BGP neighbors.
monitor protocol bgp disable keepalives

Disable debugging information related to sending and receiving BGP keep-alive messages.

Syntax

    monitor protocol bgp disable keepalives

Modes

    Operational mode

Usage Guidelines

Use this command to disable the generation of trace-level messages related to sending and receiving BGP keep-alive messages.
**monitor protocol bgp disable rib**

Disable debugging information related to the Routing Information Base (RIB).

**Syntax**

```
monitor protocol bgp disable rib
```

**Modes**

Operational mode

**Usage Guidelines**

Use this command to disable generation of trace-level messages related to the RIB.
monitor protocol bgp disable updates

Disable debugging information related to BGP routing updates.

Syntax

monitor protocol bgp disable updates

Modes

Operational mode

Usage Guidelines

Use this command to disable generation of trace-level messages related to BGP routing updates.
**monitor protocol bgp enable**

Enables debug message generation related to the acquisition of the BGP router ID and the sending and receiving of BGP messages.

**Syntax**

```
monitor protocol bgp enable
```

**Modes**

Operational mode

**Usage Guidelines**

Use this command to enable generation of trace-level messages related to the acquisition of the BGP router ID and the sending and receiving of BGP messages.
**monitor protocol bgp enable events**
Enables debug message generation related to BGP events.

**Syntax**
```
monitor protocol bgp enable events
```

**Modes**
- Operational mode

**Usage Guidelines**
Use this command to enable generation of trace-level messages related to BGP events.
monitor protocol bgp enable filters

Enables debug message generation related to BGP filters.

**Syntax**

```plaintext
monitor protocol bgp enable filters
```

**Modes**

Operational mode

**Usage Guidelines**

Use this command to enable the generation of trace-level messages related to BGP filters.
monitor protocol bgp enable fsm

Enables debug message generation related to the BGP Finite State Machine (FSM).

Syntax

```
monitor protocol bgp enable fsm
```

Modes

Operational mode

Usage Guidelines

Use this command to enable the generation of trace-level messages related to the BGP finite state machine (FSM).

A BGP router uses an FSM consisting of six states, as defined by RFC 1771. The FSM describes how and when the BGP router should make decisions about its operations with other BGP neighbors.
monitor protocol bgp enable keepalives

Display debugging information related to sending and receiving BGP keep-alive messages.

Syntax

monitor protocol bgp enable keepalives

Modes

Operational mode

Usage Guidelines

Use this command to enable the generation of trace-level messages related to sending and receiving BGP keep-alive messages.
monitor protocol bgp enable rib
Display debugging information related to the Routing Information Base (RIB).

Syntax
monitor protocol bgp enable rib

Modes
Operational mode

Usage Guidelines
Use this command to enable the generation of trace-level messages related to the RIB.
monitor protocol bgp enable updates
Display debugging information related to BGP routing updates.

Syntax

monitor protocol bgp enable updates [ in | out ]

Command Default
Debug messages are generated for both inbound and outbound routing messages.

Parameters

in
Debug information is generated only for inbound routing updates.

out
Debug information is generated only for outbound routing updates.

Modes
Operational mode

Usage Guidelines
Use this command to enable the generation of trace-level messages related to BGP routing updates.
protocols bgp <asn>

Creates a BGP instance on the router and locates it within an AS.

Syntax

```
set protocols bgp asn
delete protocols bgp asn
show protocols bgp [asn]
```

Parameters

*asn*

The number for the AS in which this router resides. Any peers of this router must be configured to know this AS number—if there is a mismatch, a peering is not established.

The number range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

Modes

Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
  }
}
```

Usage Guidelines

Use the `set` form of this command to enable a BGP instance on the router, and set its AS. All subsequent BGP configuration falls under this configuration node.

Note that you cannot create another BGP instance (that is, you cannot specify a second or further AS) unless you declare multiple BGP instances using the `multiple-instance` command.

Use the `delete` form of this command to disable BGP on the router, removing all BGP configuration.

Use the `show` form of this command to view all BGP configuration.
protocols bgp <asn> address-family ipv4-unicast

Defines parameters for controlling IPv4 unicast routes.

Syntax

- set protocols bgp <asn> address-family ipv4-unicast
- delete protocols bgp <asn> address-family ipv4-unicast
- show protocols bgp <asn> address-family ipv4-unicast

Parameters

- **asn**: The number of the AS in which this router resides.

Modes

- Configuration mode

Configuration Statement

```
protocols {
    bgp <asn> {
        address-family {
            ipv4-unicast {
            }
        }
    }
}
```

Usage Guidelines

- Use the **set** form of this command to define the parameters for IPv4 unicast routes.
- Use the **delete** form of this command to delete the parameters for IPv4 unicast routes.
- Use the **show** form of this command to view the parameters for IPv4 unicast routes.
protocols bgp <asn> address-family ipv4-unicast aggregate-address <ipv4net>

Specifies a block of IP addresses to aggregate.

Syntax

set protocols bgp asn address-family ipv4-unicast aggregate-address ipv4net { as-set | summary-only }
delete protocols bgp asn address-family ipv4-unicast aggregate-address ipv4net { as-set | summary-only }
show protocols bgp asn address-family ipv4-unicast aggregate-address ipv4net

Parameters

asn
The number of the AS in which this router resides.

ipv4net
The network from which routes are to be aggregated. The format is ip-address/prefix.

as-set
Specifies that the routes resulting from aggregation include the AS set.

summary-only
Specifies that aggregated routes are summarized. These routes are not be announced.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv4-unicast {
        aggregate-address ipv4net {
          as-set
          summary-only
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to specify a contiguous block of IP addresses to aggregate.
Use the delete form of this command to delete an aggregate address.
Use the show form of this command to view aggregate address configuration settings.
protocols bgp <asn> address-family ipv4-unicast network <ipv4net> <action>

Specifies a network to be advertised by the BGP routing process.

Syntax

set protocols bgp asn address-family ipv4-unicast network ipv4net { backdoor | route-map map-name }
delete protocols bgp asn address-family ipv4-unicast network ipv4net { backdoor | route-map [ map-name ] }
show protocols bgp asn address-family ipv4-unicast network

Parameters

asn
The number for the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

ipv4net
Multi-node. An IPv4 network in the format ip-address/prefix.
You can advertise to multiple networks by creating multiple network configuration nodes.

backdoor
Indicates that this network is reachable by a backdoor route. A backdoor network is considered to be like a local network, but is not advertised.

map-name
Specifies a configured route map to be used when advertising the network.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        address-family {
            ipv4-unicast {
                network ipv4net {
                    backdoor
                    route-map map-name
                }
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to advertise networks to BGP neighbors.
Use the delete form of this command to remove a network from the list of networks to be announced by BGP.
Use the show form of this command to view BGP network advertising configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in
the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL.
The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask
for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in
the destination field.
Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for
the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> address-family ipv4-unicast parameters dampening <time>

Enables or disables route dampening and sets route dampening values on the system.

Syntax

set protocols bgp asn address-family ipv4-unicast parameters dampening { half-life minutes | max-suppress-time minutes | re-use penalty | start-suppress-time penalty }

delete protocols bgp asn address-family ipv4-unicast parameters dampening { half-life | max-suppress-time | re-use | start-suppress-time }

show protocols bgp asn address-family ipv4-unicast parameters dampening { half-life | re-use | start-suppress-time | max-suppress-time }

Command Default

Route dampening is disabled.

Parameters

asn
The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

half-life minutes
The time period, in minutes, after which the penalty assigned to a route because of flapping is reduced by half. The numbers range from 1 through 45. The default is 15.

max-suppress-time minutes
The maximum time, in minutes, that a route may be suppressed. The numbers range from 1 through 20000. The default is four times the half-life period.

re-use penalty
The reuse threshold. If the penalty for a flapping route is reduced below this point, the route is to be brought back into use. The numbers range from 1 through 20000. The default is 750.

start-suppress-time penalty
The route suppression threshold. If the accumulated penalty for a flapping route reaches this limit, the route is suppressed. The numbers range from 1 through 20000. The default is 2000.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv4-unicast {
        parameters {
          dampening {

Brocade 5600 vRouter BGP Configuration Guide
53-1004249-01 107
Usage Guidelines

Use the set form of this command to configure route dampening. When used with no options, this command enables route dampening at the default values.

Use the delete form of this command to disable route dampening or reset route dampening parameters to default values.

Use the show form of this command to view BGP route dampening configuration settings.
protocols bgp <asn> address-family ipv4-unicast parameters distance global
<distance>

Sets the global administrative distance for IPv4 BGP routes.

Syntax

set protocols bgp asn address-family ipv4-unicast parameters distance global { external distance | internal distance | local distance }
delete protocols bgp asn address-family ipv4-unicast parameters distance global { external | internal | local }
show protocols bgp asn address-family ipv4-unicast parameters distance global [ external | internal | local ]

Parameters

asn
The number of the AS in which this router resides. The number ranges from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for a private AS.

external distance
Specifies the externally learned (eBGP) route distance. The number ranges from 1 through 255.

internal distance
Specifies the internally learned (iBGP) route distance. The number ranges from 1 through 255.

local distance
Specifies the locally generated route distance. The number ranges from 1 through 255.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        parameters {
          distance {
            global {
              external distance
              internal distance
              local distance
            }
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to set the global administrative distance for IPv4 BGP routes.
Use the **delete** form of this command to delete the global administrative for IPv4 BGP routes.

Use the **show** form of this command to display the global administrative for IPv4 BGP routes.
protocols bgp <asn> address-family ipv4-unicast parameters network-synchronization

Enables BGP network synchronization for an IPv4 unicast address family.

Syntax

set protocols bgp asn address-family ipv4-unicast parameters network-synchronization
delete protocols bgp asn address-family ipv4-unicast parameters network-synchronization
show protocols bgp asn address-family ipv4-unicast parameters network-synchronization

Command Default

BGP network synchronization is disabled by default.

Parameters

asn

The number of the AS in which this router resides. The number ranged from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for a private AS.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv4-unicast {
        parameters {
          network-synchronization
        }
      }
    }
  }
}

Usage Guidelines

BGP network synchronization applies to a static bgp route that is configured using either protocols bgp <asn> address-family ipv4-unicast network <ipv4net> <action> on page 105 or protocols bgp <asn> address-family ipv6-unicast network <ipv6net> on page 115.

Use the set form of this command to enable BGP network synchronization for an IPv4 unicast address family.
Use the delete form of this command to delete BGP network synchronization for an IPv4 unicast address family.
Use the show form of this command to display BGP network synchronization for an IPv4 unicast address family.
protocols bgp <asn> address-family ipv4-unicast parameters synchronization

Enables BGP synchronization for an IPv4 unicast address family.

Syntax

set protocols bgp asn address-family ipv4-unicast parameters synchronization
delete protocols bgp asn address-family ipv4-unicast parameters synchronization
show protocols bgp asn address-family ipv4-unicast parameters synchronization

Command Default

BGP synchronization is disabled by default.

Parameters

asn

The number of the AS in which this router resides. The number ranged from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for a private AS.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv4-unicast {
        parameters {
          synchronization
        }
      }
    }
  }
}

Usage Guidelines

BGP synchronization applies to dynamic BGP routes that are learned from sources other than a static configuration. Use the set form of this command to enable BGP synchronization for an IPv4 unicast address family.

Use the delete form of this command to delete BGP synchronization for an IPv4 unicast address family.

Use the show form of this command to display BGP synchronization for an IPv4 unicast address family.
protocols bgp <asn> address-family ipv6-unicast

Defines parameters for controlling IPv6 unicast routes.

Syntax

- set protocols bgp asn address-family ipv6-unicast
- delete protocols bgp asn address-family ipv6-unicast
- show protocols bgp asn address-family ipv6-unicast

Parameters

asn

The number of the AS in which this router resides.

Modes

Configuration mode

Configuration Statement

```plaintext
protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        
      }
    }
  }
}
```

Usage Guidelines

Use the `set` form of this command to define the parameters for IPv6 unicast routes.
Use the `delete` form of this command to delete the parameters for IPv6 unicast routes.
Use the `show` form of this command to view the parameters for IPv6 unicast routes.
protocols bgp <asn> address-family ipv6-unicast aggregate-address <ipv6net>

Specifies a contiguous block of IPv6 addresses to aggregate.

Syntax

set protocols bgp asn address-family ipv6-unicast aggregate-address ipv6net [ summary-only ]
delete protocols bgp asn address-family ipv6-unicast aggregate-address ipv6net
show protocols bgp asn address-family ipv6-unicast aggregate-address

Parameters

asn
The number of the AS in which this router resides.

ipv6net
The IPv6 network from which routes are to be aggregated. The format is ipv6-address/prefix.

summary-only
Specifies that aggregated routes are summarized. These routes are not announced.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        aggregate-address ipv6net {
          summary-only
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.
Use the set form of this command to specify a contiguous block of IPv6 addresses to aggregate.
Use the delete form of this command to delete an aggregate address.
Use the show form of this command to view aggregate address configuration settings.
protocols bgp <asn> address-family ipv6-unicast network <ipv6net>

Specifies an IPv6 network to be advertised by the BGP routing process.

Syntax

set protocols bgp asn address-family ipv6-unicast network ipv6net [ route-map map-name ]
delete protocols bgp asn address-family ipv6-unicast network ipv6net [ route-map ]
show protocols bgp asn address-family ipv6-unicast network ipv6net

Parameters

asn
  The number for the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

ipv6net
  Multi-node. An IPv6 network in the format ipv6-address/prefix.
  You can advertise to multiple networks by creating multiple network configuration nodes.

map-name
  The configured route map to be used when advertising the network.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        network ipv6net {
          route-map map-name
        }
      }
    }
  }
}

Usage Guidelines

The command applies to IPv6 unicast routes only.

Use the set form of this command to specify a network to advertise networks to BGP neighbors.

Use the delete form of this command to remove a network from the list of networks to be advertised by BGP.

Use the show form of this command to view BGP network advertising configuration settings.
protocols bgp <asn> address-family ipv6-unicast network <ipv6net> <action>

Specifies a network to be advertised by the BGP routing process.

Syntax

- set protocols bgp asn address-family ipv6-unicast network ipv6net { backdoor | route-map map-name }
- set protocols bgp asn address-family ipv6-unicast network ipv6net [ route-map map-name ]
- delete protocols bgp asn address-family ipv6-unicast network ipv6net { backdoor | route-map [ map-name ] }
- show protocols bgp asn address-family ipv6-unicast network

Parameters

- **asn**
  The number for the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

- **ipv6net**
  Multi-node. An IPv6 network in the format ip-address/prefix.
  You can advertise to multiple networks by creating multiple network configuration nodes.

- **backdoor**
  Indicates that this network is reachable by a backdoor route. A backdoor network is considered to be like a local network, but is not advertised.

- **map-name**
  Specifies a configured route map to be used when advertising the network.

Modes

Configuration mode

Configuration Statement

```plaintext
protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        network ipv6net {
          backdoor
          route-map map-name
        }
      }
    }
  }
}
```

Usage Guidelines

Use the **set** form of this command to advertise networks to BGP neighbors.

Use the **delete** form of this command to remove a network from the list of networks to be announced by BGP.

Use the **show** form of this command to view BGP network advertising configuration settings.
protocols bgp <asn> address-family ipv6-unicast parameters dampening <time>

Enables or disables route dampening and sets route dampening values on the system.

Syntax

set protocols bgp asn address-family ipv6-unicast parameters dampening { half-life minutes | max-suppress-time minutes | re-use penalty | start-suppress-time penalty }
delete protocols bgp asn address-family ipv6-unicast parameters dampening [ half-life | max-suppress-time | re-use | start-suppress-time ]
show protocols bgp asn address-family ipv6-unicast parameters dampening [ half-life | re-use | start-suppress-time | max-suppress-time ]

Command Default

Route dampening is disabled.

Parameters

asn
The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

half-life minutes
The time period, in minutes, after which the penalty assigned to a route because of flapping is reduced by half. The numbers range from 1 through 45. The default is 15.

max-suppress-time minutes
The maximum time, in minutes, that a route may be suppressed. The numbers range from 1 through 20000. The default is four times the half-life period.

re-use penalty
The reuse threshold. If the penalty for a flapping route is reduced below this point, the route is to be brought back into use. The numbers range from 1 through 20000. The default is 750.

start-suppress-time penalty
The route suppression threshold. If the accumulated penalty for a flapping route reaches this limit, the route is suppressed. The numbers range from 1 through 20000. The default is 2000.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        parameters {
          dampening {
          }}
        }
      }
    }
  }
}
Usage Guidelines

Use the **set** form of this command to configure route dampening. When used with no options, this command enables route dampening at the default values.

Use the **delete** form of this command to disable route dampening or reset route dampening parameters to default values.

Use the **show** form of this command to view BGP route dampening configuration settings.
protocols bgp <asn> address-family ipv6-unicast parameters distance global <distance>

Sets the global administrative distance of BGP routes for an IPv6 unicast address family.

Syntax

set protocols bgp asn address-family ipv6-unicast parameters distance global { external distance | internal distance | local distance }
delete protocols bgp asn address-family ipv6-unicast parameters distance global { external | internal | local }
show protocols bgp asn address-family ipv6-unicast parameters distance global [ external | internal | local ]

Command Default

The default values for the external, internal, and local distances are mentioned in the Parameters table.

Parameters

asn

The number of the AS in which this router resides. The number ranges from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for a private AS.

distance

external distance

Specifies the externally learned (eBGP) route distance. The number ranges from 1 through 255. Default is 20.

internal distance

Specifies the internally learned (iBGP) route distance. The number ranges from 1 through 255. Default is 200.

local distance

The locally generated route distance. The number ranges from 1 through 255. Default is 200.

Modes

Configuration mode

Configuration Statement

```bash
protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        parameters {
          distance {
            global {
              external distance
              internal distance
              local distance
            }
          }
        }
      }
    }
  }
}```
Usage Guidelines

Use the \texttt{set} form of this command to set the global administrative distance of BGP routes for an IPv6 unicast address family.

Use the \texttt{delete} form of this command to delete the global administrative distance of BGP routes for an IPv6 unicast address family.

Use the \texttt{show} form of this command to display the global administrative distance of BGP routes for an IPv6 unicast address family.
protocols bgp <asn> address-family ipv6-unicast parameters network-synchronization

Enables BGP network synchronization for an IPv6 unicast address family.

Syntax

set protocols bgp asn address-family ipv6-unicast parameters network-synchronization
delete protocols bgp asn address-family ipv6-unicast parameters network-synchronization
show protocols bgp asn address-family ipv6-unicast parameters network-synchronization

Command Default

BGP network synchronization is disabled by default.

Parameters

asn

The number of the AS in which this router resides. The number ranges from 1 through 4294967294. The subrange,
64512 through 65534, is reserved for a private AS.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        parameters {
          network-synchronization {
          }
        }
      }
    }
  }
}

Usage Guidelines

When BGP network synchronization is enabled, the system checks its own routing table to see whether it has learned an iBGP
route from IGP before it advertises the route to eBGP peers.

BGP network synchronization applies to a static bgp route that is configured using either protocols bgp <asn> address-family
ipv4-unicast network <ipv4net> <action> on page 105 or protocols bgp <asn> address-family ipv6-unicast network <ipv6net>
on page 115.

Use the set form of this command to enable BGP network synchronization for an IPv6 unicast address family.

Use the delete form of this command to disable BGP network synchronization for an IPv6 unicast address family.
Use the **show** form of this command to display the BGP network synchronization configuration for an IPv6 unicast address family.
protocols bgp <asn> address-family ipv6-unicast parameters synchronization

Enables BGP synchronization for an IPv6 unicast address family.

Syntax

set protocols bgp asn address-family ipv6-unicast parameters synchronization
delete protocols bgp asn address-family ipv6-unicast parameters synchronization
show protocols bgp asn address-family ipv6-unicast parameters synchronization

Command Default

BGP synchronization is disabled by default.

Parameters

asn

The number of the AS in which this router resides. The number ranged from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for a private AS.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        parameters {
          synchronization
        }
      }
    }
  }
}

Usage Guidelines

BGP synchronization applies to dynamic BGP routes that are learned from sources other than a static configuration.

Use the set form of this command to enable BGP synchronization for an IPv6 unicast address family.

Use the delete form of this command to delete BGP synchronization for an IPv6 unicast address family.

Use the show form of this command to display BGP synchronization for an IPv6 unicast address family.
protocols bgp asn log

Enables BGP logs.

Syntax

```
set protocols bgp asn log { all | events | filters | fsm | keepalive | nsm | update }
delete protocols bgp asn log { all | events | filters | fsm | keepalive | nsm | update }
show protocols bgp asn log { all | events | filters | fsm | keepalive | nsm | update }
```

Command Default

None

Parameters

```
asn
  The number of the AS in which this router resides. The number ranges from 1 through 4294967295.
all
  Enables all BGP logs.
events
  Enables only BGP event logs.
filters
  Enables only BGP filter logs.
fsm
  Enables only BGP finite-state machine logs.
keepalive
  Enables only BGP keepalive logs.
nsm
  Enables only BGP network services module (NSM) logs.
update
  Enables only BGP update logs.
```

Modes

Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
    log {
      all
      events
      filters
      fsm
      keepalive
      nsm
```
Usage Guidelines

Use the `set` form of this command to enable BGP logs.

Use the `delete` form of this command to remove BGP logs.

Use the `show` form of this command to view BGP logs.
bgp asn log update
   Enables BGP update logs.

Syntax
   set protocols bgp asn log { all | in | out }
   delete protocols bgp asn log { all | in | out }
   show protocols bgp asn log { all | in | out }

Command Default
   None

Parameters
   asn
      The number of the AS in which this router resides. The number ranges from 1 through 4294967295.
   all
      Enables all BGP logs.
   in
      Enables BGP update-in logs.
   out
      Enables BGP update-out logs.

Modes
   Configuration mode

Configuration Statement
   protocols {
      bgp asn {
         log update {
            all
            in
            out
         }
      }
   }

Usage Guidelines
   Use the set form of this command to enable BGP update logs.
   Use the delete form of this command to remove BGP update logs.
   Use the show form of this command to view BGP update logs.
protocols bgp <asn> parameters always-compare-med

Directs the router to compare the multi-exit discriminator (MED) for paths from neighbors in different AS.

Syntax

- set protocols bgp asn parameters always-compare-med
- delete protocols bgp asn parameters always-compare-med
- show protocols bgp asn parameters

Command Default

The MED is not compared.

Parameters

- asn

  The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

Modes

Configuration mode

Configuration Statement

```bash
protocols {
  bgp asn {
    parameters {
      always-compare-med
    }
  }
}
```

Usage Guidelines

Use the **set** form of this command to have the router compare the MED for paths from neighbors in different AS. The MED is compared only if the AS path for the compared routes is identical.

Use the **delete** form of this command to disable MED comparison.

Use the **show** form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters bestpath as-path <action>

Directs the router to compare the AS paths during best path selection.

Syntax

set protocols bgp asn parameters bestpath as-path { confed | ignore }
delete protocols bgp asn parameters bestpath as-path { confed | ignore }
show protocols bgp asn parameters bestpath

Command Default

By default, when making the best-path selection, the router does not compare AS_PATHs within a confederation and does not ignore the AS_PATH.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

confed

Directs the router to compare the AS paths within a confederation during best path selection.

ignore

Directs the router to ignore AS_PATH during best path selection.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      bestpath {
        as-path {
          confed
          ignore
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to direct the router to compare the AS paths during best path selection.

Use the delete form of this command to restore the default best-path selection behavior.

Use the show form of this command to view BGP best path selection configuration settings.
protocols bgp <asn> parameters bestpath compare-routerid

Directs the router to compare identical routes received from different external peers during best path selection.

Syntax

```
set protocols bgp <asn> parameters bestpath compare-routerid
delete protocols bgp <asn> parameters bestpath compare-routerid
show protocols bgp <asn> parameters bestpath
```

Command Default

By default, when making the best-path selection, the router does not compare identical routes received from different external peers.

Parameters

- **asn**
  
The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

Modes

- **Configuration mode**

Configuration Statement

```
protocols {
  bgp <asn> {
    parameters {
      bestpath {
        compare-routerid
      }
    }
  }
}
```

Usage Guidelines

Use the **set** form of this command to direct the router to compare identical routes received from different external peers during best path selection, and select as the best path the route with the lowest router ID.

Use the **delete** form of this command to restore the default best-path selection behavior.

Use the **show** form of this command to view BGP best path selection configuration settings.
protocols bgp <asn> parameters bestpath igp-metric-ignore

Ignores Interior Gateway Protocol (IGP) metrics during BGP best-path selection.

Syntax

set protocols bgp asn parameters bestpath igp-metric-ignore
delete protocols bgp asn parameters bestpath igp-metric-ignore

Command Default

By default, the router considers IGP metrics during best-path selection.

Parameters

asn

Number of the AS in which this router resides. Number ranges from 1 through 4294967294. Subrange of 64512 through 65534 is reserved for private AS.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      bestpath {
        igp-metric-ignore
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to disable IGP metrics during BGP best-path selection.

Use the delete form of this command to accept IGP metrics during the behavior of default best-path selection.
protocols bgp <asn> parameters bestpath med <action>

Directs the router to compare the multi-exit discriminator (MED) among paths learned from confederation peers during best path selection.

Syntax

set protocols bgp asn parameters bestpath med { confed | missing-as-worst }
delete protocols bgp asn parameters bestpath med { confed | missing-as-worst }
show protocols bgp asn parameters bestpath

Command Default

By default, when making the best-path selection, the router does not consider the MED.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

confed

Compare the MED among confederation paths.

missing-as-worst

Treat a missing MED as the least preferred one.

Modes

Configuration mode

Configuration Statement

```plaintext
protocols {
  bgp asn {
    parameters {
      bestpath {
        med {
          confed
          missing-as-worst
        }
      }
    }
  }
}
```

Usage Guidelines

Use the `set` form of this command to direct the router to compare the MED among paths learned from confederation peers during best-path selection.

Use the `delete` form of this command to restore the default best-path selection behavior.

Use the `show` form of this command to view BGP best path selection configuration settings.
protocols bgp <asn> parameters maximum-as-limit <number>

Allows BGP routes with the AS_PATH or AS4_PATH attribute containing ASes lesser than the specified number. If the AS_PATH or AS4_PATH attribute contains ASes greater than the configured value, the update messages containing the AS_PATH or AS4_PATH attribute is ignored and the session is retained.

Syntax

set protocols bgp asn parameters maximum-as-limit number
delete protocols bgp asn parameters maximum-as-limit number

Command Default

None.

Parameters

asn

The number for the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

number

Number specifying the ASes in the AS_PATH or AS4_PATH attribute. The value ranges from 1 through 254.

Modes

Configuration mode.

Configuration Statement

protocols {
  bgp asn {
    parameters {
      maximum-as-limit number
    }
  }
}

Usage Guidelines

Use the set form of this command to allow BGP routes with AS_PATH or AS4_PATH attribute containing ASes lesser than the specified number.

Use the delete form of this command to delete BGP routes with AS_PATH or AS4_PATH attribute containing ASes lesser than the specified number.
protocols bgp <asn> parameters med-out-delay <minutes>

Specifies the time interval between the attempts to set a MED value that is based on the IGP metric.

Syntax

```
set protocols bgp asn parameters med-out-delay minutes
delete protocols bgp asn parameters med-out-delay
```

Command Default

The default time interval for a MED update is 10 minutes.

Parameters

asn

Number for the AS in which this router resides. Number ranges from 1 through 4294967294. Subrange of 64512 through 65534, is reserved for private AS.

minutes

The time interval in minutes, that a MED is updated. The interval ranges from 10 through 600 minutes.

Modes

Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
    parameters {
      med-out-delay minutes {
    }
  }
}
```

Usage Guidelines

Use the set form of this command to specify the time interval between the attempts to set a MED value.

Use the delete form of this command to disable the periodic MED update and hence the MED is updated every time the IGP metric changes.
protocols bgp <asn> parameters default local-pref <pref>

Sets default routing behaviors on the system.

Syntax

set protocols bgp <asn> parameters default local-pref <pref>
delete protocols bgp <asn> parameters default local-pref
show protocols bgp <asn> parameters default

Command Default

The value of the local-pref attribute is 100. IPv4 unicast is the default address family.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

local-pref pref

Specifies the degree of preference that iBGP peers are to give local routes during BGP best path selection. The higher the value, the more the route is to be preferred. The numbers range from 0 through 4294967295. The default is 100.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp <asn> {
        parameters {
            default {
                local-pref <pref>
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to override default local route preferences and automatic address family exchanges.
Use the delete form of this command to reset the route preferences and address family exchanges to the default.
Use the show form of this command to view BGP default routing configuration settings.
protocols bgp <asn> parameters deterministic-med

Enables or disables enforcing of deterministic Multi-Exit Discriminator (MED).

Syntax

set protocols bgp asn parameters deterministic-med
delete protocols bgp asn parameters deterministic-med
show protocols bgp asn parameters

Command Default

Deterministic MED is not enforced.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      deterministic-med
    }
  }
}

Usage Guidelines

Use the set form of this command to enforce the deterministic comparison of the MED value between all paths received from within the same autonomous system.

Use the delete form of this command to disable required MED comparison.

Use the show form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters enforce-first-as

Enables or disables forcing eBGP peers to list AS number at the beginning of the AS_PATH attribute in incoming updates.

Syntax

set protocols bgp asn parameters enforce-first-as
delete protocols bgp asn parameters enforce-first-as
show protocols bgp asn parameters

Command Default

Disabled.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        parameters {
            enforce-first-as
        }
    }
}

Usage Guidelines

When this feature is enabled, the router denies updates received from an external BGP (eBGP) peer unless the AS number is listed at the beginning of the AS_PATH in the incoming update. This prevents “spooﬁ” situations where a misconﬁgured or unauthorized peer is misdirecting traffic by advertising a route as if it were sourced from another autonomous system.

Use the set form of this command to direct the router to enforce listing of an eBGP peer’s AS number at the beginning of the AS_PATH.

Use the delete form of this command to disable this behavior.

Use the show form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters extended-asn-capability

Enables or disables extended ASN capability.

Syntax

set protocols bgp asn parameters extended-asn-capability
delete protocols bgp asn parameters extended-asn-capability
show protocols bgp asn parameters extended-asn-capability

Command Default

Disabled.

Parameters

asn

The number of the AS in which this router resides. The number ranges from 1 through 4294967294. The subrange 64512 through 65534 is reserved for private AS.

parameters

BGP parameters.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        parameters {
            extended-asn-capability
        }
    }
}

Usage Guidelines

Use the set form of this command to enable extended ASN capability.
Use the delete form of this command to disable extended ASN capability.
Use the show form of this command to view extended ASN capability configuration settings.
protocols bgp <asn> parameters graceful-restart <action>

Enables or disables graceful restart of the BGP process.

Syntax

set protocols bgp <asn> parameters graceful-restart { graceful-reset | restart-time seconds | stalepath-time seconds }
delete protocols bgp <asn> parameters graceful-restart { graceful-reset | restart-time seconds | stalepath-time seconds }
show protocols bgp <asn> parameters graceful-restart

Command Default

Paths for restarting peers are retained for at most 360 seconds.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange 64512 through 65534 is reserved for private AS.

graceful-reset

Enables graceful reset capability.

restart-time seconds

Enables maximum time needed for neighbor to restart. The default is 360 seconds.

stalepath-time seconds

Sets the maximum interval, in seconds, to retain stale paths for a restarting peer. If this interval is exceeded, all stale paths are removed.

The number range from 1 through 3600. The default is 360.

The default value for this attribute is optimal for most deployments, and changing this value can have negative effects on network behavior. We recommend that only experienced network operators change this value.

Modes

Configuration mode

Configuration Statement

```bash
protocols {
  bgp <asn> {
    parameters {
      graceful-restart {
        graceful-reset
        restart-time seconds
        stalepath-time seconds
      }
    }
  }
}
```
Usage Guidelines

Use the `set` form of this command to direct the router to restart gracefully when it is reset.

Use the `delete` form of this command to disable graceful restart.

Use the `show` form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters log-neighbor-changes

Enables or disables logging of the status of BGP neighbors.

Syntax

set protocols bgp asn parameters log-neighbor-changes
delete protocols bgp asn parameters log-neighbor-changes
show protocols bgp asn parameters

Command Default

Disabled.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      log-neighbor-changes
    }
  }
}

Usage Guidelines

This feature helps detect network problems, by recording when BGP neighbors come up or go down, and when they reset. Log messages are sent to the main log file.

Use the set form of this command to direct the router to log changes in adjacencies for BGP neighbors.

Use the delete form of this command to disable logging of neighbor status changes.

Use the show form of this command to view global BGP configuration settings.

Even when this feature is disabled, the system tracks neighbor resets; these resets can be seen in the output of the show ip bgp neighbors command.
protocols bgp <asn> parameters maximum-paths ebgp <max-paths>

Specifies the maximum number of eBGP paths to a destination.

Syntax

set protocols bgp asn parameters maximum-paths ebgp max-paths
delete protocols bgp asn parameters maximum-paths ebgp [ max-paths ]
show protocols bgp asn parameters maximum-paths ebgp

Command Default

A single eBGP path can be inserted into the routing table.

Parameters

asn

The number for the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

max-paths

The maximum number of eBGP paths to a destination to be inserted in the routing table. The numbers range from 2 through 64, where 1 indicates that a single path can be inserted into the routing table. This has the same effect as not configuring the maximum-paths feature.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      maximum-paths {
        ebgp max-paths
      }
    }
  }
}

Usage Guidelines

Use this command to specify the maximum number of eBGP paths to a destination to allow in the routing table. Normally, the single best path is determined and then added to the routing table. This command allows more than one path to be added to the routing table.

To be considered as one of a set of multipaths to a destination, candidate paths must have identical weight, LOCAL PREFERENCE, AS PATH LENGTH, ORIGIN, MULTI_EXIT_DISC (MED), and PEER AS.

Once the paths are selected, traffic load is shared across them on a per session basis. That is, each new session is routed across the path that has the fewest active sessions. To achieve this, the route is advertised with the nexthop address being the
interface address rather than the address of the best path. Once traffic is routed to the interface, it can select the path based on current traffic loads.

The attribute set for the advertised route is based on the attribute set from the best path, with the following attributes aggregated from the multipaths, including the best path: AS_PATH, ORIGIN, COMMUNITIES, and EXTENDED COMMUNITIES.

If the deterministic MED option is configured (see protocols bgp <asn> parameters deterministic-med on page 135), a set of multipaths is derived for each peer AS. The set of paths for the peer AS associated with the selected best path are added to the routing table.

If the always-compare MED option is configured (see protocols bgp <asn> parameters always-compare-med on page 127), the MED is compared across all paths from all AS. The set of multipaths can be distributed from one AS to another.

**NOTE**
Since each path requires additional memory and processing resources, the number of maximum-paths should be kept to a minimum. This is especially true for large routing tables.

**NOTE**
The multipath feature is only supported in IPv4 unicast environments.

Use the **set** form of this command to specify the maximum number of paths to a destination.

Use the **delete** form of this command to remove the configuration and allow only a single best path to a destination in the routing table.

Use the **show** form of this command to view eBGP maximum path configuration settings.
protocols bgp <asn> parameters maximum-paths ibgp <max-paths>

Specifies the maximum number of iBGP paths to a destination.

Syntax

set protocols bgp asn parameters maximum-paths ibgp max-paths
delete protocols bgp asn parameters maximum-paths ibgp [ max-paths ]
show protocols bgp asn parameters maximum-paths ibgp

Command Default

A single iBGP path can be inserted into the routing table.

Parameters

asn
The number for the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange,
64512 through 65534, is reserved for private AS.

max-paths
The maximum number of iBGP paths to a destination to be inserted in the routing table. The numbers range from 2
through 64, where 1 indicates that a single path can be inserted into the routing table. This has the same effect as not
configuring the maximum-paths feature.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        parameters {
            maximum-paths {
                ibgp max-paths
            }
        }
    }
}

Usage Guidelines

Use this command to specify the maximum number of iBGP paths to a destination to allow in the routing table. Normally, the
single best path is determined and then added to the routing table. This command allows more than one path to be added to
the routing table.

To be considered as one of a set of multipaths to a destination, candidate paths must have identical weight, LOCAL
PREFERENCE, AS PATH LENGTH, ORIGIN, MULTI_EXIT_DISC (MED), and AS_PATH.

Once the paths are selected, traffic load is shared across them on a per session basis. That is, each new session is routed
across the path that has the fewest active sessions. To achieve this, the route is advertised with the nexthop address being the
interface address rather than the address of the best path. Once traffic is routed to the interface, it can select the path based on current traffic loads.

The attribute set for the advertised route is based on the attribute set from the best path, with the following attributes aggregated from the multipaths, including the best path: AS_PATH, ORIGIN, COMMUNITIES, and EXTENDED COMMUNITIES.

If the deterministic MED option is configured (see protocols bgp <asn> parameters deterministic-med on page 135), a set of multipaths is derived for each peer AS. The set of paths for the peer AS associated with the selected best path are added to the routing table.

If the always-compare MED option is configured (see protocols bgp <asn> parameters always-compare-med on page 127), the MED is compared across all paths from all AS. The set of multipaths can be distributed across AS.

**NOTE**
Since each path requires additional memory and processing resources, the number of **maximum-paths** should be kept to a minimum. This is especially true for large routing tables.

**NOTE**
The multipath feature is only supported in IPv4 unicast environments.

Use the **set** form of this command to specify the maximum number of paths to a destination.

Use the **delete** form of this command to remove the configuration and allow only a single best path to a destination in the routing table.

Use the **show** form of this command to view iBGP maximum path configuration settings.
protocols bgp <asn> parameters no-client-to-client-reflection

Disables client-to-client route reflection.

Syntax

set protocols bgp asn parameters no-client-to-client-reflection
delete protocols bgp asn parameters no-client-to-client-reflection
show protocols bgp asn parameters

Command Default

By default, client-to-client route reflection is disabled.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        parameters {
            no-client-to-client-reflection
        }
    }
}

Usage Guidelines

Use the set form of this command to disable client-to-client route reflection.
Use the delete form of this command to restore default setting (no client-to-client route reflection).
Use the show form of this command to view client-to-client route reflection.
protocols bgp <asn> parameters no-fast-external-failover

Enables or disables automatic resetting of BGP sessions for failed links.

Syntax

set protocols bgp asn parameters no-fast-external-failover
delete protocols bgp asn parameters no-fast-external-failover
show protocols bgp asn parameters

Command Default

Disabled. By default, sessions are automatically reset.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      no-fast-external-failover
    }
  }
}

Usage Guidelines

When fast external failover is enabled, then BGP sessions for directly adjacent external peers are immediately reset if the link fails.

Use the set form of this command to disable fast external failover.

Use the delete form of this command to restore fast external failover.

Use the show form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters no-rtm

Enables the installing of BGP routes into the main routing table.

Syntax

set protocols bgp asn parameters no-rtm
delete protocols bgp asn parameters no-rtm
show protocols bgp asn parameters

Command Default

Disabled.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private autonomous systems.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      no-rtm
    }
  }
}

Usage Guidelines

This command enables better support of iBGP route reflector for iBGP scaling. When configured, learned eBGP and iBGP routes are advertised to the peers but not installed into the main routing table. As a result, these routes cannot be forwarded by this router. The no-rtm command should be configured first before BGP peering. The no-rtm command takes effect immediately once configured.

Previous routes should already be installed to the main routing table prior to issuing this command. Therefore, configure, commit, and save the no-rtm command, then reboot the system to ensure a consistent state with BGP route installations.

Use the set form of this command to enable the installing of BGP routes into the main routing table.

Use the delete form of this command to disable the installing of BGP routes into the main routing table.

Use the show form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters router-id <id>

Sets a fixed BGP router ID for the router, overriding the automatic ID selection process.

Syntax

set protocols bgp asn parameters router-id id
delete protocols bgp asn parameters router-id [ id ]
show protocols bgp asn parameters

Command Default

When router ID is not explicitly set, then the router ID is automatically set to the IP address of the loopback address, if configured. If the loopback address is not configured, the router ID is set to the first IP address configured on a physical interface.

Parameters

asn

The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

id

The ID to be used by the router as the BGP router ID.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      router-id id
    }
  }
}

Usage Guidelines

Use the set form of this command to configure a fixed router ID for the local BGP routing process. This ID overrides the router ID automatic set by the system.

Use the delete form of this command to remove the fixed router ID and restore the automatically selected ID.

Use the show form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters scan-time <seconds>

Sets the scanning interval for the router.

Syntax

set protocols bgp asn parameters scan-time seconds
delete protocols bgp asn parameters scan-time seconds
show protocols bgp asn parameters scan-time

Command Default
Scans take place every 15 seconds.

Parameters

asn
The number of the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

seconds
The interval, in seconds, at which the router scans for BGP routing information. The numbers range from 5 through 60. The default is 15.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      scan-time seconds
    }
  }
}

Usage Guidelines

Use the set form of this command to set the interval at which the router scans for BGP routing information.
Use the delete form of this command to reset the scanning interval to the default.
Use the show form of this command to view global BGP configuration settings.
protocols bgp <asn> timers
Sets BGP timers globally for the local router.

Syntax

```
set protocols bgp asn timers { keepalive seconds | holdtime seconds }
delete protocols bgp asn timers [ keepalive | holdtime ]
show protocols bgp asn timers [ keepalive | holdtime ]
```

Command Default
The default for the keep-alive timer is 60 seconds. The default for the holdtime timer is 180 seconds.

Parameters

```
asn
The number for the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.
```

```
keepalive seconds
The frequency, in seconds, with which the local router sends keep-alive messages to neighbors. The numbers range from 1 through 65535. The default is 60.
```

```
holdtime seconds
The maximum interval, in seconds, after which if the local router has not received a keep-alive message from the neighbor, a neighbor is declared dead. The range is 0 and 4 through 65535, where 0 disables the holdtime timer. The default is 180.
```

Modes
Configuration mode

Configuration Statement
```
protocols {
  bgp asn {
    timers {
      keepalive seconds
      holdtime seconds
    }
  }
}
```

Usage Guidelines
Use the `set` form of this command to set global BGP timers for monitoring the health of remote peers. These timers will be applied to all remote peers unless a neighbor has timers explicitly configured for it. Timers explicitly specified for a neighbor override the timers set globally.

Use the `delete` form of this command to restore global BGP timers to default values.

Use the `show` form of this command to view global BGP timer configuration settings.
reset ip bgp <address>

Resets a BGP connection.

Syntax

reset ip bgp { ipv4 | ipv6 } [ soft [ in [ prefix-filter ] | out ] ]

Command Default

Both inbound and outbound sessions are reset.

Parameters

ipv4

Resets the connection for the IPv4 BGP neighbor at the specified address.

ipv6

Resets the connection for the IPv6 BGP neighbor at the specified address.

soft

Uses soft reconfiguration for the reset.

in

Resets with soft reconfiguration for only inbound sessions.

prefix-filter

Resets the outbound route filter (ORF) filter.

out

Resets with soft reconfiguration only outbound sessions.

Modes

Operational mode

Usage Guidelines

Use this command to reset a BGP connection to a peer.
reset ip bgp <address> ipv4 unicast <action>

Resets the BGP neighbor for the specified IPv4 unicast address family.

Syntax

```plaintext
reset ip bgp { ipv4 | ipv6 } ipv4 unicast { soft [ in | prefix-filter ] | out }
```

Parameters

- `ipv4`
  - Resets the connection for the IPv4 BGP neighbor at the specified address.
- `ipv6`
  - Resets the connection for the IPv6 BGP neighbor at the specified address.
- `soft`
  - Uses soft reconfiguration for the reset.
- `in`
  - Resets with soft reconfiguration for only inbound sessions.
- `prefix-filter`
  - Resets the existing ORF prefix-list for specified IPv4 unicast neighbor.
- `out`
  - Resets with soft reconfiguration for only outbound sessions.

Modes

- Operational mode

Usage Guidelines

Use this command to reset the BGP neighbor for the specified IPv4 unicast address family.
reset ip bgp <address> ipv6 unicast <action>
    Resets the BGP neighbor for the specified IPv6 unicast address family.

Syntax
    reset ip bgp { ipv4 | ipv6 } ipv6 unicast { soft [ in [ prefix-filter ] | out ] }

Parameters
    ipv4
        Resets the connection for the IPv4 BGP neighbor at the specified address.
    ipv6
        Resets the connection for the IPv6 BGP neighbor at the specified address.
    soft
        Uses soft reconfiguration for the reset.
    in
        Resets with soft reconfiguration only inbound sessions.
    prefix-filter
        Resets the outbound route filter (ORF) filter prefix-list for the specified IPv6 unicast neighbor.
    out
        Resets with soft reconfiguration only outbound sessions.

Modes
    Operational mode

Usage Guidelines
    Use this command to reset the BGP neighbor for the specified IPv6 unicast address family.
reset ip bgp all
   Resets all BGP peering sessions.

Syntax
   reset ip bgp all

Modes
   Operational mode

Usage Guidelines
   Use this command to reset all BGP peering sessions.
reset ip bgp all ipv4 unicast
   Resets all IPv4 BGP unicast peering sessions.

Syntax
   reset ip bgp all ipv4 unicast

Modes
   Operational mode

Usage Guidelines
   Use this command to reset all IPv4 BGP unicast peering sessions.
reset ip bgp all ipv4 unicast soft

Resets all IPv4 BGP unicast peering sessions without clearing the BGP session information.

Syntax

reset ip bgp all ipv4 unicast soft [ in [ prefix-filter ] | out ]

Parameters

in

Performs a reset and restore of BGP routes on inbound traffic. When soft-reconfiguration inbound is not configured, the system sends a route refresh notice to its peers.

prefix-filter

Stores the received prefix and checks the policy rules to add the proper prefix to inbound traffic.

out

Performs a reset and restore of BGP routes on outbound traffic and sends a route update to its peers. When soft-reconfiguration outbound is configured, the system checks the BGP RIB, policy rule, and sends out the proper routes in an update notice to its peers.

Modes

Operational mode

Usage Guidelines

Use this command to reset all IPv4 BGP unicast peering sessions without clearing the BGP session information.
reset ip bgp all ipv6 unicast

Resets all IPv6 BGP unicast peering sessions.

Syntax

reset ip bgp all ipv6 unicast

Modes

Operational mode

Usage Guidelines

Use this command to reset all IPv6 BGP unicast peering sessions.
reset ip bgp all ipv6 unicast soft

Resets all IPv6 BGP unicast peering sessions without clearing the BGP session information.

Syntax
reset ip bgp all ipv6 unicast soft [ in [ prefix-filter ] ] out ]

Parameters

in
Performs a reset and restore of BGP routes on inbound traffic. When soft-reconfiguration inbound is not configured, the system sends a route refresh notice to its peers.

prefix-filter
Stores the received prefix and checks the policy rules to add the proper prefix to inbound traffic.

out
Performs a reset and restore of BGP routes on outbound traffic and sends a route update to its peers. When soft-reconfiguration outbound is configured, the system checks the BGP RIB, policy rule, and sends out the proper routes in an update notice to its peers.

Modes

Operational mode

Usage Guidelines

Use this command to reset all IPv6 BGP unicast peering sessions without clearing the BGP session information.
reset ip bgp all soft

Resets the BGP routing tables and removes the TCP session between two devices, but does not clear the BGP establishment of a peering session.

Syntax

reset ip bgp all soft [ in [ prefix-filter ] | out ]

Parameters

in

Performs a reset and restore of BGP routes on inbound traffic. When soft-reconfiguration inbound is not configured, the system sends a route refresh notice to its peers.

prefix-filter

Stores the received prefix and checks the policy rules to add the proper prefix to inbound traffic.

out

Performs a reset and restore of BGP routes on outbound traffic and sends a route update to its peers. When soft-reconfiguration outbound is configured, the system checks the BGP RIB, policy rule, and sends out the proper routes in an update notice to its peers.

Modes

Operational mode

Usage Guidelines

Use this command to reset the BGP routing tables and removes the TCP session between two devices, but does not clear the BGP establishment of a peering session.
**reset ip bgp ipv4 unicast dampening**

Resets BGP route flap dampening information for IPv4 unicast.

**Syntax**

```
reset ip bgp ipv4 unicast dampening [ipv4 [ipv4-mask] | ipv4net]
```

**Command Default**

When used with no option, this command resets route dampening information and unsuppresses routes for all BGP peers.

**Parameters**

- **ipv4**
  Resets route flap dampening information for the IPv4 peer at the specified address.

- **ipv4-mask**
  An IPv4 network mask.

- **ipv4net**
  Resets route flap dampening information for all peers on the specified network. The format is `ip-address/prefix`.

**Modes**

Operational mode

**Usage Guidelines**

Use this command to reset BGP route flap dampening information for IPv4 unicast.
reset ip bgp ipv6 unicast dampening

Resets BGP route flap dampening information for IPv6 unicast.

Syntax

reset ip bgp ipv6 unicast dampening [ipv6 [ipv6-mask] | ipv6net]

Parameters

ipv6

Resets route flap dampening information for the IPv6 peer at the specified address.

ipv6-mask

An IPv6 network mask.

ipv6net

Resets route flap dampening information for all peers on the specified network. The format is ip-address/prefix.

Modes

Operational mode

Usage Guidelines

Use this command to reset BGP route flap dampening information for IPv6 unicast.
show ip bgp
Displays BGP routes.

Syntax
show ip bgp [ summary ]

Command Default
Displays all BGP routes by default.

Parameters
summary
Shows summary BGP route information.

Modes
Operational mode

Usage Guidelines
Use this command to display the BGP routing table.
show ip bgp attribute-info

Displays BGP attribute information.

Syntax

    show ip bgp attribute-info

Modes

    Operational mode

Usage Guidelines

    Use this command to display BGP attribute information.
show ip bgp cidr-only
   Displays BGP routes with CIDR network masks.

Syntax
   show ip bgp cidr-only

Modes
   Operational mode

Usage Guidelines
   Use this command to display only routes with non-natural network masks; that is, Classless Inter Domain Routing network masks.
show ip bgp cluster-ids
Displays the BGP cluster IDs.

Syntax
show ip bgp cluster-ids

Modes
Operational mode

Usage Guidelines
Use this command to display BGP cluster IDs.
show ip bgp community <community>
Displays BGP routes belonging to the specified BGP community.

Syntax
show ip bgp community community [ exact-match ]

Parameters

community
A BGP community identifier in the form AA:NN (where AA and NN are in the range of 0 through 65535), one of the well-known BGP communities local-AS, no-export, or no-advertise, or a space-separated list of up to four community identifiers.

exact-match
Displays only routes that have an exact match.

Modes

Operational mode

Usage Guidelines
Use this command to display the BGP routes belonging to up to four BGP communities.
show ip bgp community-info

Displays BGP community information.

Syntax

show ip bgp community-info

Modes

Operational mode

Usage Guidelines

Use this command to display BGP community information.
show ip bgp community-list <list-name>
   Displays BGP routes permitted by the specified community list.

Syntax
   show ip bgp community-list list-name [ exact-match ]

Parameters
   list-name
      A preconfigured list of BGP communities.
   exact-match
      Displays only routes that have an exact match.

Modes
   Operational mode

Usage Guidelines
   Use this command to display the BGP routes permitted by the specified community list.
show ip bgp dampening dampened-paths <action>
Displays IPv4 BGP routes that are currently dampened.

Syntax
show ip bgp dampening { dampened-paths | flap-statistics }

Parameters
- dampened-paths
  Display dampened BGP paths.
- flap-statistics
  Display statistics for BGP route flaps.

Modes
Operational mode

Usage Guidelines
Use this command to display the IPv4 BGP routes that are currently dampened.
show ip bgp filter-list <as-path-list-name>
Displays routes matching a list of autonomous system paths.

Syntax

```
show ip bgp filter-list as-path-list-name
```

Parameters

`as-path-list-name`
Name of an autonomous system path list.

Modes

Operational mode

Usage Guidelines

Use this command to filter displayed routes according to a preconfigured list of autonomous system paths.

BGP filter lists are defined using the `policy` command. For information about creating filter lists, see the *Brocade 5600 vRouter Routing Policies Configuration Guide*. 
show ip bgp ipv4 unicast

Displays information for IPv4 unicast BGP routes.

Syntax

```
show ip bgp ipv4 unicast [ ipv4 | ipv4net [ longer-prefixes ] | summary ]
```

Command Default

Displays all IPv4 unicast BGP routes by default.

Parameters

- **ipv4**: Show BGP information for the specified address.
- **ipv4net**: Show BGP information for the specified network.
- **longer-prefixes**: Displays any routes more specific than the one specified.
- **summary**: Displays summary IPv4 unicast route information.

Modes

Operational mode

Usage Guidelines

Use this command to display IPv4 unicast routes in the BGP routing table.
show ip bgp ipv4 unicast cidr-only

Displays IPv4 unicast BGP routes with Classless Inter Domain Routing (CIDR) network masks.

Syntax

    show ip bgp ipv4 unicast cidr-only

Modes

Operational mode

Usage Guidelines

Use this command to display only BGP IPv4 unicast routes with non-natural network masks, that is, CIDR network masks.
**show ip bgp ipv4 unicast community <community>**
Displays IPv4 unicast BGP routes belonging to the specified community.

**Syntax**
```
show ip bgp ipv4 unicast community community [ exact-match ]
```

**Parameters**
- **community**
  A BGP community identifier in the form AA: NN (where AA and NN are in the range of 0 through 65535), one of the well-known BGP communities `local-AS`, `no-export`, or `no-advertise`, or a space-separated list of up to four community identifiers.
- **exact-match**
  Displays only routes that have an exact match.

**Modes**
Operational mode

**Usage Guidelines**
Use this command to display BGP IPv4 unicast routes belonging to up to four BGP communities.
show ip bgp ipv4 unicast community-list <list-name>
Displays IPv4 unicast BGP routes permitted by the specified community list.

Syntax

    show ip bgp ipv4 unicast community-list list-name [ exact-match ]

Parameters

    list-name
        A preconfigured list of BGP communities.

    exact-match
        Displays routes that have an exact match.

Modes

    Operational mode

Usage Guidelines

    Use this command to display BGP IPv4 unicast routes permitted by the specified community list.
show ip bgp ipv4 unicast filter-list <as-path-list-name>
Displays IPv4 unicast BGP routes permitted by the specified AS path list.

Syntax
  show ip bgp ipv4 unicast filter-list as-path-list-name

Parameters
  as-path-list-name
    Name of an autonomous system path list.

Modes
  Operational mode

Usage Guidelines
  Use this command to display BGP IPv4 unicast routes permitted by the specified AS path list.
show ip bgp ipv4 unicast paths
   Displays BGP IPv4 unicast path information.

Syntax
   show ip bgp ipv4 unicast paths

Modes
   Operational mode

Usage Guidelines
   Use this command to display BGP IPv4 unicast path information.
show ip bgp ipv4 unicast prefix-list <list-name>
Displays IPv4 unicast BGP routes matching a prefix list.

Syntax

show ip bgp ipv4 unicast prefix-list list-name

Parameters

list-name
Name of a defined prefix list.

Modes

Operational mode

Usage Guidelines

Use this command to display BGP IPv4 unicast routes matching a preconfigured prefix list.

Prefix lists are configured using the policy command. For information about creating prefix lists, see the Brocade 5600 vRouter Routing Policies Configuration Guide.
show ip bgp ipv4 unicast regexp <expression>

Displays IPv4 unicast BGP routes matching an AS path regular expression.

Syntax

```
show ip bgp ipv4 unicast regexp expression
```

Parameters

- `expression`:
  A POSIX-style regular expression representing a set of AS paths.

Modes

- Operational mode

Usage Guidelines

Use this command to display BGP IPv4 unicast routes matching the specified AS path regular expression.
**show ip bgp ipv4 unicast route-map <map-name>**

Displays IPv4 unicast BGP routes matching a route map.

**Syntax**

```
show ip bgp ipv4 unicast route-map map-name
```

**Parameters**

- `map-name`
  
  Name of a defined route map.

**Modes**

- Operational mode

**Usage Guidelines**

Use this command to display IPv4 unicast BGP routes matching a preconfigured route map.

Route maps are defined using the `policy` command. For information about creating route maps, see the *Brocade 5600 vRouter Routing Policies Configuration Guide.*
**show ip bgp ipv4 unicast summary**

Displays a summary of BGP IPv4 unicast information.

**Syntax**

```
show ip bgp ipv4 unicast summary
```

**Modes**

Operational mode

**Usage Guidelines**

Use this command to display a summary of BGP IPv4 unicast information.
show ip bgp ipv6 unicast
Displays information for IPv6 unicast BGP routes.

Syntax
show ip bgp ipv6 unicast [ ipv6 | ipv6net [ longer-prefixes ] | summary ]

Command Default
Displays all IPv6 unicast BGP routes by default.

Parameters
ipv6
Displays routes for the neighbor at the specified IPv6 address.

ipv6net
Displays routes for the specified IPv6 network.

longer-prefixes
Displays any routes more specific than the one specified.

summary
Shows summary BGP route information for BGP neighbor.

Modes
Operational mode

Usage Guidelines
Use this command to display IPv6 unicast routes in the BGP routing table.
show ip bgp ipv6 unicast community <community>

Displays BGP routes belonging to the specified BGP community.

Syntax

show ip bgp ipv6 unicast community [ AA:NN | exact-match | local-AS | no-advertise | no-export ]

Parameters

AA:NN
A BGP community identifier in the form AA:NN (where AA and NN are in the range of 0 through 65535), one of the well-known BGP communities local-AS, no-export, or no-advertise, or a space-separated list of up to four community identifiers.

exact-match
Displays only routes that have an exact match.

local-AS
Show BGP information for specified community number.

no-advertise
Show routes not advertised to any peer.

no-export
Show routes not exported to next AS.

Modes

Operational mode

Usage Guidelines

Use this command to display the BGP routes belonging to up to four BGP communities.
show ip bgp ipv6 unicast community-list <list-name>

Displays BGP routes permitted by the specified community list.

Syntax

```
show ip bgp ipv6 unicast community-list list-name [ exact-match ]
```

Parameters

- `list-name`
  A preconfigured list of BGP communities.

- `exact-match`
  Displays routes that have an exact match.

Modes

- Operational mode

Usage Guidelines

Use this command to display the BGP routes permitted by the specified community list.
show ip bgp ipv6 unicast dampening <action>
Displays detailed information about dampening in IPv6 environments.

Syntax
  show ip bgp ipv6 unicast dampening { dampened-paths | flap-statistics }

Parameters
  dampened-paths
    Display paths suppressed due to dampening.
  flap-statistics
    Display flap statistics of routes.

Modes
  Operational mode

Usage Guidelines
  Use this command to display detailed information about dampening in IPv6 environments. Enable BGP IPv6 dampening to maintain dampened-path information in memory.
show ip bgp ipv6 unicast filter-list <as-path-list-name>
Displays routes matching a list of autonomous system paths.

Syntax

    show ip bgp ipv6 unicast filter-list as-path-list-name

Parameters

    as-path-list-name
    Name of an autonomous system path list.

Modes

    Operational mode

Usage Guidelines

Use this command to filter displayed routes according to a preconfigured list of autonomous system paths.
BGP filter lists are defined using the `policy as-path-list` command.
show ip bgp ipv6 unicast prefix-list <list-name>
Displays IPv6 unicast BGP routes matching a prefix list.

Syntax

    show ip bgp ipv6 unicast prefix-list list-name

Parameters

    list-name
    Name of a defined prefix list.

Modes

    Operational mode

Usage Guidelines

Use this command to display BGP IPv6 unicast routes matching a preconfigured prefix list.

Prefix lists are configured using the policy command. For information about creating prefix lists, see the Brocade 5600 vRouter Routing Policies Configuration Guide.
show ip bgp ipv6 unicast regexp <expression>

Displays routes matching an AS path regular expression.

Syntax

```
show ip bgp ipv6 unicast regexp expression
```

Parameters

expression

A POSIX-style regular expression representing a set of AS paths.

Modes

Operational mode

Usage Guidelines

Use this command to display routes matching a regular expression representing an AS path list.
**show ip bgp paths**
Displays all BGP paths.

**Syntax**
```
show ip bgp paths
```

**Modes**
Operational mode

**Usage Guidelines**
Use this command to display all BGP paths.
show ip bgp prefix-list <list-name>
Displays BGP routes matching a prefix list.

Syntax

    show ip bgp prefix-list list-name

Parameters

list-name
    Name of a defined prefix list.

Modes

    Operational mode

Usage Guidelines

Use this command to display routes that match a preconfigured prefix list.

Prefix lists are configured using the policy command. For information about creating prefix lists, see the Brocade 5600 vRouter Routing Policies Configuration Guide.
show ip bgp regexp <expression>
Displays routes matching an AS path regular expression.

Syntax

```
show ip bgp regexp expression
```

Parameters

- **expression**
  A POSIX-style regular expression representing a set of AS paths.

Modes

- Operational mode

Usage Guidelines

Use this command to display routes matching a regular expression representing an AS path list.
show ip bgp route-map <map-name>
  Displays routes matching a route map.

Syntax
  show ip bgp route-map map-name

Parameters
  map-name
    The name of a defined route map.

Modes
  Operational mode

Usage Guidelines
  Use this command to display routes matching a preconfigured route map.

  Route maps are defined using the policy command. For information about creating route maps, see the Brocade 5600 vRouter Routing Policies Configuration Guide.
show ip bgp scan
Displays BGP scan status.

Syntax

show ip bgp scan

Modes

Operational mode

Usage Guidelines

Use this command to display BGP scan status.
**show ip route bgp**

Displays BGP routes.

**Syntax**

```
show ip route bgp
```

**Modes**

Operational mode

**Usage Guidelines**

Use this command to display BGP routes.

**Examples**

The following example shows BGP routes.

```
vyyatta@vyatta:~$ show ip route bgp
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
      I - ISIS, B - BGP, > - selected route, * - FIB route

  B  10.1.0.0/24 [20/75] via 10.1.0.4 inactive, 1d00h46m
  B>* 10.100.100.4/32 [20/75] via 10.1.0.4 (recursive via 10.3.0.1), 1d00h46m
  B>* 10.104.104.4/32 [20/75] via 10.1.0.4 (recursive via 10.3.0.1), 1d00h46m

  B>* 172.29.0.0/24 [20/75] via 10.1.0.4 (recursive via 10.3.0.1), 1d00h36m
  B>* 192.168.0.0/24 [20/75] via 10.1.0.4 (recursive via 10.3.0.1), 05:15:56
vyatta@vyatta:~$```
show monitoring protocols bgp
Displays BGP protocol debugging flags.

Syntax
  show monitoring protocols bgp

Modes
  Operational mode

Usage Guidelines
  Use this command to display BGP protocol debugging flags.
Overview

BGP Virtual Route Refectors are typically deployed by installing hardware capable of handling high speed data plane forwarding and is deployed without accompanying hardware. Virtual Route Reflector functionality in the software enables routing with fewer routing pairs and eliminates the need for fully meshed Asynchronous Systems (AS).

Multiple peer routers can connect through iBGP with the route reflector which serves as a central point-of-contact server, enabling access to clients of the route reflector, that is, other routers participating in a full mesh. One or more router is configured as route reflector in a BGP topology to provide redundancy.

Route reflector requires BGP to be enabled. The BGP software component is not part on the data plane architecture.
BGP multiple cluster IDs

The BGP multiple cluster IDs let you configure a route reflector such that the route reflector associates a cluster ID with each peer to unite groups of clients into different clusters. This association also allows you to disable the reflection of routes between route reflection clients in the same cluster, that is, intra-cluster route reflection.

A route reflector and its clients form a cluster. If the route reflector is connected to a group of clients that are fully meshed, you can assign a cluster ID to each peer of the route reflector peer or assign a cluster ID to a peer group. You can also disable client-to-client route reflection for the cluster that is connected to the route reflector. On disabling the intra-cluster client-to-client route reflection, the loop prevention mechanism is modified automatically to consider multiple cluster IDs.

You can reduce the number of updates in the network by disabling the intra-cluster client-to-client route reflection which in-turn increases the convergence speed.

Configuring multiple cluster IDs

In this section, you configure multiple cluster IDs for a network that contains routers and route reflectors. In the example, there are five routers one of which is a route reflector (RR), and four routers are route reflector clients (R1, R2, R3, and R4).

Clients R1 and R2 are fully meshed and the two routers can share prefixes with each other without involving the RR.

There are two logical clusters, cluster 1 and cluster 2. Clients R1 and R2 are in cluster 1 and have 1 as the cluster ID that is configured on RR. Clients R3 and R4 are in cluster 2 and have 2 as the cluster ID. In the given example, RR reflects routes from R3 to R1 and from R1 to R4 but blocks route reflection between R1 and R2 because R1 and R2 are fully meshed.

You can now disable client-to-client route reflection inside a specific cluster by using protocols bgp <asn> parameters no-client-to-client-reflection cluster-id <cluster-id> on page 207. Therefore, RR does not reflect routes between clients from the cluster for which the client-to-client route reflection is disabled. All other types of reflection, such as client-to-non client routes, from one cluster to another continue to work. In this example the client-to-client route reflection is disabled for cluster 1.

FIGURE 18 BGP multiple cluster-ids
To configure multiple cluster IDs, perform the following steps in configuration mode.

**protocols bgp <asn> neighbor <id> address-family ipv4-unicast route-reflector-client**

Specifies this neighbor as a route reflector client for IPv4 routes.

**Syntax**

```
set protocols bgp asn neighbor id address-family ipv4-unicast route-reflector-client
delete protocols bgp asn neighbor id address-family ipv4-unicast route-reflector-client
show protocols bgp asn neighbor id address-family ipv4-unicast
```

**Command Default**

Disabled.

**Parameters**

- **asn**
  The number for the AS in which this router resides. The numbers ranges from 1 through 4294967295.

- **id**
  The IPv4 or IPv6 address of a BGP neighbor.

**Modes**

Configuration mode

**Configuration Statement**

```
protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv4-unicast {
                    route-reflector-client
                }
            }
        }
    }
}
```

**Usage Guidelines**

Use the `set` form of this command to make the local router a BGP route reflector, and to designate the specified neighbor as a route reflector client.

Another technology designed to help ASs with large numbers of iBGP peers is route reflection. In a standard BGP implementation, all iBGP peers must be fully meshed. Because of this requirement, when an iBGP peer learns a route from another iBGP peer, the receiving router does not forward the route to any of its iBGP peers, since these routers should have learned the route directly from the announcing router.

In a route reflector environment the iBGP peers are no longer fully meshed. Instead, each iBGP peer has an iBGP connection to one or more route reflectors (RRs). Routers configured with a connection to an RR server are referred to as RR clients. Only
the RR server is configured to be aware that the RR client is part of an RR configuration; from the RR client’s point of view, it is configured normally, and does not have any awareness that it is part of a RR configuration.

In route reflection, internal peers of an RR server are categorized into two types:

- **Client peers.** The RR server and its client peers form a cluster. Within a cluster, client peers need not be fully meshed, but must have an iBGP connection to at least one RR in the cluster.
- **Non-client peers.** Non-client peers, including the RR server, must be fully meshed.

An RR environment is unlike a regular environment, where iBGP peers never forward a route update to other iBGP peers (which is the reason why each iBGP peer must peer with all other peers). When an RR server receives an iBGP update from an RR client, these route updates can also be sent to all other RR clients. When an RR server receives a route update from a peer, it selects the best path based on its path selection rule. After the best path is selected, the RR server chooses its action depending on the type of the peer from which it learned the best path.

- If the route was learned from a client peer, the RR reflects the route to both client and non-client peers. All iBGP updates from client peers are reflected to all other client peers in the cluster. This is done regardless of whether the update was the best path for the RR itself.
- If the route was learned from a non-client iBGP peer, it is reflected out to all RR client peers.
- If the route was learned from an eBGP peer, the route is reflected to all RR clients and all non-clients.

Use the `delete` form of this command to remove the neighbor as a route reflector client.

Use the `show` form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-reflector-client

Specifies this neighbor as a route reflector client for IPv6 routes.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast route-reflector-client
delete protocols bgp asn neighbor id address-family ipv6-unicast route-reflector-client
show protocols bgp asn neighbor id address-family ipv6-unicast

Command Default

Disabled.

Parameters

asn

Mandatory. The number for the AS in which this router resides. The ranges from 1 through 4294967295.

id

Mandatory. The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv6-unicast {
                    route-reflector-client
                }
            }
        }
    }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to configure the BGP neighbor as a route reflector client.
Use the delete form of this command to remove the configuration.
Use the show form of this command to view the configuration.
protocols bgp <asn> neighbor <id> cluster-id <cluster-id>

Defines a cluster id for a neighbor.

Syntax

set protocols bgp asn neighbor id cluster-id cluster-id
delete protocols bgp asn neighbor id cluster-id cluster-id
show protocols bgp asn neighbor id cluster-id cluster-id

Parameters

asn
The number of the AS in which this router resides. The number ranges from 1 through 4294967295.

id
Multi-node. The IPv4 or IPv6 address of a BGP neighbor.
You can define multiple BGP neighbors by creating multiple neighbor configuration nodes.

cluster-id
Neighbor cluster ID. When you change a cluster ID for a neighbor, BGP automatically does an inbound soft refresh
and an outbound soft refresh for all iBGP peers.
The cluster ID can be in dotted decimal format such as 192.168.7.4 or decimal format such as 23, with a maximum of
4 bytes.
The vrouter modifies a cluster ID that is configured in decimal format such as 23 to dotted decimal format such as
0.0.0.23 when it appears in a configuration file.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      cluster-id cluster-id {
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to define a cluster ID for a neighbor.
Use the delete form of this command to remove a cluster ID for a neighbor.
Use the show form of this command to view a cluster ID for a neighbor.
protocols bgp <asn> parameters cluster-id <id>

Sets the cluster ID for a BGP route reflection cluster.

Syntax

set protocols bgp asn parameters cluster-id id
delete protocols bgp asn parameters cluster-id id
show protocols bgp asn parameters

Parameters

asn
The number of the AS in which this router resides. The number ranges from 1 through 4294967295.

id
A network address uniquely identifying the route reflection cluster.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        parameters {
            cluster-id id
        }
    }
}

Usage Guidelines

Use the set form of this command to specify the route reflection cluster-ID for an internal route reflection cluster.

When a cluster has only one route reflector, the cluster uses the router ID of the route reflector as an ID. If more than one route reflector is deployed in a cluster (for example, to provide redundancy), you must provide an ID for the cluster. In this case, the cluster ID is assigned to every route reflector in the cluster.

Use the delete form of this command to remove a cluster ID.

Use the show form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters no-client-to-client-reflection all

Enables or disables route reflection from a BGP route reflector to clients.

**Syntax**

set protocols bgp asn parameters no-client-to-client-reflection all
delete protocols bgp asn parameters no-client-to-client-reflection all
show protocols bgp asn parameters

**Command Default**

By default, client-to-client-reflection is enabled.

**Parameters**

*asn*

The number of the AS in which this router resides. The numbers ranges from 1 through 4294967295.

**Modes**

Configuration mode

**Configuration Statement**

```bash
protocols {
  bgp asn {
    parameters {
      no-client-to-client-reflection
    }
  }
}
```

**Usage Guidelines**

Use the `set` form of this command to disable route reflection from a BGP route reflector to clients. When client-to-client route reflection is enabled, the configured route reflector reflects routes from one client to other clients.

Use the `delete` form of this command to enable client-to-client route reflection.

Use the `show` form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters no-client-to-client-reflection cluster-id any

Enables or disables route reflection for all the intra cluster client-to-client route reflection.

Syntax

set protocols bgp asn parameters no-client-to-client-reflection cluster-id any
delete protocols bgp asn parameters no-client-to-client-reflection cluster-id any
show protocols bgp asn parameters

Parameters

asn
The number of the AS in which this router resides. The number ranges from 1 through 4294967295.

any
All clusters

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters no-client-to-client-reflection cluster-id any {
    }
  }
}

Usage Guidelines

Use the set form of this command to disable intra-cluster client-to-client route reflection from a BGP route reflector to all clusters.

Use the delete form of this command to enable intra-cluster client-to-client route reflection from a BGP route reflector to all clusters.

Use the show form of this command to view global BGP configuration settings.
protocols bgp <asn> parameters no-client-to-client-reflection cluster-id <cluster-id>

Enables or disables route reflection for a cluster.

Syntax

set protocols bgp asn parameters no-client-to-client-reflection cluster-id cluster-id
delete protocols bgp asn parameters no-client-to-client-reflection cluster-id cluster-id
show protocols bgp asn parameters

Parameters

asn
The number of the AS in which this router resides. The number ranges from 1 through 4294967295.

cluster-id
Neighbor cluster-id.
The cluster ID can be in dotted decimal format such as 192.168.7.4 or decimal format such as 23, with a maximum of 4 bytes.
The vrouter modifies a cluster ID that is configured in decimal format such as 23 to dotted decimal format such as 0.0.0.23 when it appears in a configuration file.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters no-client-to-client-reflection cluster-id cluster-id {
    }
  }
}

Usage Guidelines

Use the set form of this command to disable intra-cluster client-to-client route reflection from a BGP route reflector to the specified cluster. When the software changes reflection state for the given cluster ID BGP sends an outbound soft refresh to all clients.
Use the delete form of this command to enable intra-cluster client-to-client route reflection from a BGP route reflector to the specified cluster.
Use the show form of this command to view global BGP configuration settings.
protocols bgp <asn> peer-group <group-name> address-family ipv4-unicast route-reflector-client

Specify this peer group as a route reflector client.

Syntax

set protocols bgp asn peer-group group-name address-family ipv4-unicast route-reflector-client
delete protocols bgp asn peer-group group-name address-family ipv4-unicast route-reflector-client
show protocols bgp asn peer-group group-name address-family ipv4-unicast

Command Default

Disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

group-name

The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group group-name {
            address-family {
                ipv4-unicast {
                    route-reflector-client
                }
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to configure the BGP peer group as a route reflector client.
Use the delete form of this command to remove the configuration.
Use the show form of this command to view the configuration.
protocols bgp <asn> peer-group <group-name> address-family ipv6-unicast route-reflector-client

Specify this peer group as a route reflector client.

Syntax

set protocols bgp asn peer-group group-name address-family ipv6-unicast route-reflector-client
delete protocols bgp asn peer-group group-name address-family ipv6-unicast route-reflector-client
show protocols bgp asn peer-group group-name address-family ipv6-unicast

Command Default

Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

group-name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group group-name {
      address-family {
        ipv6-unicast {
          route-reflector-client
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.
Use the set form of this command to configure the BGP peer group as a route reflector client.
Use the delete form of this command to remove the configuration.
Use the show form of this command to view the configuration.
protocols bgp <asn> peer-group <group-name> cluster-id <cluster-id>

Defines a cluster ID for a peer group.

Syntax

    set protocols bgp asn peer-group name cluster-id cluster-id
    delete protocols bgp asn peer-group name cluster-id cluster-id
    show protocols bgp asn peer-group name cluster-id cluster-id

Parameters

    asn
        The number of the AS in which this router resides. The number ranges from 1 through 4294967295.
    name
        Multi-node. The peer-group name.
    cluster-id
        Neighbor cluster ID. When you change a cluster ID for a neighbor, BGP automatically does an inbound soft refresh and an outbound soft refresh for all iBGP peers.
        The cluster ID can be in dotted decimal format such as 192.168.7.4 or decimal format such as 23, with a maximum of 4 bytes.
        The vrouter modifies a cluster ID that is configured in decimal format such as 23 to dotted decimal format such as 0.0.0.23 when it appears in a configuration file.

Modes

    Configuration mode

Configuration Statement

    protocols {
        bgp asn {
            peer-group name{
                cluster-id cluster-id {
                }
            }
        }
    }

Usage Guidelines

    Use the set form of this command to define a cluster ID for a peer group.
    Use the delete form of this command to remove the cluster ID for a peer group.
    Use the show form of this command to view the cluster ID for a peer group.
Confederations Commands

- protocols bgp <asn> parameters confederation identifier <asn> ................................................................. 212
- protocols bgp <asn> parameters confederation peers <asn> ........................................................................... 213
protocols bgp <asn> parameters confederation identifier <asn>

Defines a BGP confederation.

Syntax

- set protocols bgp asn parameters confederation identifier asn
- delete protocols bgp asn parameters confederation identifier asn
- show protocols bgp asn parameters confederation

Parameters

- bgp asn
  - The number of the AS in which this router resides. The number ranges from 1 through 4294967295.
- identifier asn
  - The AS number of the BGP confederation. The numbers range from 1 through 4294967295.

Modes

- Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
    parameters {
      confederation {
        identifier asn
      }
    }
  }
}
```

Usage Guidelines

- Use the set form of this command to create a BGP confederation.
- Use the delete form of this command to remove the BGP confederation.
- Use the show form of this command to view BGP confederation configuration settings.
protocols bgp <asn> parameters confederation peers <asn>

Defines the AS that make up a BGP confederation.

Syntax

set protocols bgp asn parameters confederation peers asn
delete protocols bgp asn parameters confederation peers asn
show protocols bgp asn parameters confederation

Parameters

bgp asn
The number of the AS in which this router resides. The number ranges from 1 through 4294967295.

peers asn
The subautonomous systems that make up BGP confederation. The numbers range from 1 through 4294967295. Multiple AS can be specified in a space-separated list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    parameters {
      confederation {
        peers asn
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to list the subautonomous systems that to be the members of a BGP confederation. To a peer outside the confederation, the confederation appears as a single autonomous system.

Use the delete form of this command to remove an AS from a confederation.

Use the show form of this command to view BGP confederation configuration settings.
Synchronization

- Basic synchronization configuration.....................................................................................................................................................................215
- Verifying the configuration..........................................................................................................................................................................................218
- Graceful restart..................................................................................................................................................................................................................221

Basic synchronization configuration

To enable traffic to be routed through multiple asynchronous systems (AS), IGP must propagate iBGP routes within its AS before they advertise them to peers outside its AS. All routers in an AS must learn of a route before BGP advertises the route outside of the AS. A BGP router must have synchronization disabled (the default setting) to validate these routes and install them into its routing table.

In this section, you configure BGP synchronization on the routers labeled BGP17, BGP18, BGP19, BGP20, and BGP21 in the reference network diagram. The routers are advertising their routes on networks 10.0.40.0/24 and 10.0.50.0/24.

This section presents a sample configuration for BGP synchronization. The configuration example is based on the reference diagram in the following figure.

FIGURE 19 BGP synchronization topology

BGP synchronization must have AS200 configured as a transit between AS100 and AS300, and AS200 must have all routers meshed through iBGP.
BGP17 advertises a route to BGP18 through eBGP and the route is forwarded using iBGP to BGP20 through BGP19. For BGP20 to forward the route outside its AS to BGP 21, BGP19 must add the network in its routing table or the packet be dropped. BGP synchronization enables BGP19 to learn the network and to notify BGP20, before allowing BGP20 to forward the route to BGP21.

To create a basic BGP synchronization configuration, perform the steps in the following table:

**TABLE 18 Basic BGP synchronization configuration**

<table>

### Verifying the configuration

To display routes and their status for BGP 17, enter the command in the following example:

vyatta@BGP17# show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
> - selected route, * - FIB route, p - stale info

```
S *> 10.0.0.0/8 [1/0] via 10.1.34.1, dp0p160p1
C *> 10.1.34.0/24 is directly connected, dp0p160p1
O 20.1.1.0/24 [110/10] is directly connected, dp0p192p1, 15:39:00
C *> 20.1.1.0/24 is directly connected, dp0p192p1
O *> 30.1.1.0/24 [110/20] via 20.1.1.1, dp0p192p1, 00:26:54
O *> 40.1.1.0/24 [110/30] via 20.1.1.1, dp0p192p1, 00:26:54
O *> 50.1.1.0/24 [110/40] via 20.1.1.1, dp0p192p1, 00:26:54
C *> 100.1.1.0/24 is directly connected, dp0p224p1
C *> 127.0.0.0/8 is directly connected, lo
O *> 175.18.18.18/32 [110/20] via 20.1.1.1, dp0p192p1, 00:26:54
```
To verify the network, next hop routes, and their status in the BGP synchronization configuration, enter the command in the following example:

```
vyatta@BGP17# show ip bgp neigh 20.1.1.1 advertised-routes
BGP table version is 2, local router ID is 100.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop            Metric LocPrf Weight Path
*> 100.1.1.0/24     20.1.1.2                      100  32768 i

Total number of prefixes 1
```

To display the routes and their status for BGP 18, enter the command in the following example:

```
vyyatta@BGP18# show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
> - selected route, * - FIB route, p - stale info
S *> 10.0.0.0/8 [1/0] via 10.1.34.1, dp0p160p1
C *> 10.1.34.0/24 is directly connected, dp0p160p1
O 20.1.1.0/24 [110/10] is directly connected, dp0p192p1, 1d00h18m
C *> 20.1.1.0/24 is directly connected, dp0p192p1
O 30.1.1.0/24 [110/10] is directly connected, dp0p224p1, 21:20:09
C *> 30.1.1.0/24 is directly connected, dp0p224p1
O *> 40.1.1.0/24 [110/20] via 30.1.1.2, dp0p224p1, 16:28:46
O *> 50.1.1.0/24 [110/30] via 30.1.1.2, dp0p224p1, 00:50:46
B *> 100.1.1.0/24 [20/0] via 20.1.1.2, dp0p192p1, 00:02:08
C *> 127.0.0.0/8 is directly connected, lo
C *> 175.18.18.18/32 is directly connected, lo
O *> 175.20.20.20/32 [110/10] via 30.1.1.2, dp0p224p1, 00:04:19
O *> 175.21.21.21/32 [110/40] via 30.1.1.2, dp0p224p1, 00:44:16
```

To display advertised routes for BGP 18, enter the command in the following example:

```
vyyatta@BGP18# show ip bgp neigh 175.20.20.20 advertised-routes
BGP table version is 3, local router ID is 175.18.18.18
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop            Metric LocPrf Weight Path
*>i100.1.1.0/24     20.1.1.2                      100      0 100 i

Total number of prefixes 1
```

To display ospf updates for BGP 18, enter the command in the following example:

```
vyyatta@BGP18# show ip ospf data
OSPF Router with ID (20.1.1.1) (Process ID 0)
Router Link States (Area 0.0.0.0)
Link ID       ADV Router  Age  Seq# CkSum  Link count
20.1.1.1      20.1.1.1  1338  0xc944 3
20.1.1.2      20.1.1.2  1740  0x4e29 1
30.1.1.1      30.1.1.1  1584  0x6ab7 2
40.1.1.1      40.1.1.1  656   0x2bce 3
50.1.1.1      50.1.1.1  906   0x86db 2

Net Link States (Area 0.0.0.0)
Link ID       ADV Router  Age  Seq# CkSum
```
To display routes and their status for BGP 19, enter command in the following example:

```
vyatta@BGP19# run show ip route
```

Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
> - selected route, * - FIB route, p - stale info

```
S    *> 10.0.0.0/8 [1/0] via 10.1.34.1, dp0p160p1

O    *> 175.18.18.18/32 [110/20] via 40.1.1.2, dp0p192p1, 00:51:41
C    *> 175.20.20.20/32 is directly connected, lo
O    *> 175.21.21.21/32 [110/20] via 50.1.1.2, dp0p224p1, 00:49:48
```

To display routes and their status for BGP 20, enter the command in the following example:

```
vyatta@BGP20# run show ip route
```

Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
> - selected route, * - FIB route, p - stale info
To verify the network, next hop routes, and their status in the BGP synchronization configuration, enter the command in the following example:

```
vtyatta@BGP20# show ip bgp
BGP table version is 6, local router ID is 175.20.20.20
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, l - labeled
S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop            Metric LocPrf Weight Path
*>100.1.1.0/24     20.1.1.2                 0    100      0 100 i

Total number of prefixes 1
```

To display received routes for BGP 21, enter the command in the following example:

```
vtyatta@BGP21# show ip bgp neigh 50.1.1.1 received-routes
BGP table version is 8, local router ID is 175.21.21.21
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

protocols bgp <asn> neighbor <id>

Defines a BGP neighbor.

Syntax

set protocols bgp asn neighbor id
delete protocols bgp asn neighbor id
show protocols bgp asn neighbor id

Parameters

asn
The number for the autonomous system (AS) in which this router resides. The number ranges from 1 through 4294967295.

id
Multi-node. The IPv4 or IPv6 address of a BGP neighbor.
You can define multiple BGP neighbors by creating multiple neighbor configuration nodes.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
    }
  }
}

Usage Guidelines

Use the set form of this command to define a BGP neighbor.
Use the delete form of this command to remove a BGP neighbor.
Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast

Enables the IPv4 unicast address-family for a neighbor and defines parameters for controlling IPv4 unicast routes when subsequent configuration parameters and options are present.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast
delete protocols bgp asn neighbor id address-family ipv4-unicast
show protocols bgp asn neighbor id address-family ipv4-unicast

Command Default

Disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
        }
      }
    }
  }
}

Usage Guidelines

Use the **set** form of this command to enable the IPv4 unicast address-family for a neighbor and to define parameters for controlling IPv4 unicast routes when subsequent configuration parameters and options are present.

Use the **delete** form of this command to disable the IPv4 unicast address-family for a neighbor and to remove the configured parameters for controlling IPv4 unicast routes.

Use the **show** form of this command to view the configuration settings for the neighbor IPv4 unicast address-family.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast allowas-in number <number>

Allows or disallows receiving BGP advertisements containing the AS path of the local router.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast allowas-in number number
delete protocols bgp asn neighbor id address-family ipv4-unicast allowas-in number number
show protocols bgp asn neighbor id address-family ipv4-unicast

Command Default

Readvertisement is disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

number

Specifies the number of times to accept an AS path containing the readvertisement of the ASN of the local router. The numbers range from 1 through 10. The default is 3.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          allowas-in {
            number number
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to allow the router to accept BGP AS paths advertising the AS number of the router. This situation could indicate a routing loop, and by default such an update is dropped. However, you can use this command to direct the router to accept updates readvertising its AS number for a specified number of times.
Use the **delete** form of this command to disallow readvertisement of the AS path of the router.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast attribute-unchanged <action>

Allows the router to send updates to a neighbor with unchanged attributes.

**Syntax**

- set protocols bgp <asn> neighbor <id> address-family ipv4-unicast attribute-unchanged [ as-path | med | next-hop ]
- delete protocols bgp <asn> neighbor <id> address-family ipv4-unicast attribute-unchanged [ as-path | med | next-hop ]
- show protocols bgp <asn> neighbor <id> address-family ipv4-unicast attribute-unchanged

**Command Default**

Disabled.

**Parameters**

- **asn**
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

- **id**
  The IPv4 or IPv6 address of a BGP neighbor.

- **as-path**
  Propagates the route update with unchanged AS_PATH attribute.

- **med**
  Propagates the route update with unchanged Multi Exit Discriminator (MED).

- **next-hop**
  Propagates the route update with unchanged next hop.

**Modes**

Configuration mode

**Configuration Statement**

```ini
protocols {
  bgp <asn> {
    neighbor <id> {
      address-family {
        ipv4-unicast {
          attribute-unchanged {
            as-path
            med
            next-hop
          }
        }
      }
    }
  }
}
```
Usage Guidelines

Use the **set** form of this command to direct the router to propagate routing updates without modifying the BGP AS_PATH, multi-exit discriminator (MED), or next-hop attribute.

Use the **delete** form of this command to restore normal modification of BGP attributes.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast capability graceful-restart

Enables or disables the graceful restart capability for the specified BGP neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast capability graceful-restart [ disable ]
delete protocols bgp asn neighbor id address-family ipv4-unicast graceful-restart [ disable ]
show protocols bgp asn neighbor id address-family ipv4-unicast graceful-restart

Command Default

Disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

disable

Disables the graceful restart capability.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv4-unicast {
                    graceful-restart {
                        disable
                    }
                }
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to enable the graceful restart capability for the specified BGP neighbor.

Use the delete form of this command to disable the graceful restart capability for the specified BGP neighbor.

Use the show form of this command to view the BGP graceful restart configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast capability orf prefix-list <state>

Advertises support for Outbound Route Filtering (ORF) for updating BGP capabilities advertised and received from this neighbor.

Syntax

set protocols bgp <asn> neighbor <id> address-family ipv4-unicast capability orf prefix-list { receive | send }
delete protocols bgp <asn> neighbor <id> address-family ipv4-unicast capability orf prefix-list { receive | send }
show protocols bgp <asn> neighbor <id> address-family ipv4-unicast capability orf prefix-list

Command Default

By default, the session is brought up with minimal capability on both sides.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

prefix-list
Advertise prefix-list ORF capability to this neighbor.

receive
Advertise the ability to receive the ORF from this neighbor.

send
Advertise the capability to send the ORF to this neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp <asn> {
    neighbor <id> {
      address-family {
        ipv4-unicast {
          capability {
            orf {
              prefix-list {
                receive
                send
              }
            }
          }
        }
      }
    }
  }
}
Usage Guidelines

In general, BGP-4 requires that if a BGP speaker receives an OPEN message with an unrecognized optional parameter, the speaker must terminate BGP peering. This makes it difficult to introduce new capabilities into the protocol. The Capabilities parameter allows graceful negotiation of BGP capabilities without requiring a peer to terminate peering.

This command specifies use of BGP Outbound Route Filtering (ORF) to send and receive capabilities. Using ORF minimizes the number of BGP updates that are sent between peer routers.

Use the **set** form of this command to specify BGP ORF capabilities to be used in capability negotiation.

Use the **delete** form of this command to remove the ORF capability.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast default-originate route-map <map-name>

Enables or disables forwarding of the default route to a BGP neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast default-originate route-map map-name
delete protocols bgp asn neighbor id address-family ipv4-unicast default-originate route-map map-name
show protocols bgp asn neighbor id address-family ipv4-unicast default-originate

Command Default

The default route is not distributed.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

map-name
Specifies a configured route map to be used when advertising the default route.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          default-originate {
            route-map map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to enable the router to advertise the default route 0.0.0.0 to this BGP neighbor. This route can then be used by the neighbor to reach the local router if no other routes are available.

If a route map is specified, the default route is advertised if two conditions are satisfied:

- The route map includes a match ip address clause.
• A route exists that exactly matches the IP access list.

Route maps are configured using `protocols bgp <asn> neighbor <id> local-as <asn>` on page 298.

Use the `delete` form of this command to disable forwarding of the default route or to delete a route map.

Use the `show` form of this command to view BGP neighbor default route origination settings.

**NOTE**

In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL.

The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field.

Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast disable-send-community <state>

Disables sending of community attributes to the specified neighbor.

**Syntax**

- `set protocols bgp asn neighbor id address-family ipv4-unicast disable-send-community [ extended | standard ]`
- `delete protocols bgp asn neighbor id address-family ipv4-unicast disable-send-community [ extended | standard ]`
- `show protocols bgp asn neighbor id address-family ipv4-unicast disable-send-community`

**Command Default**

Communities are sent by default.

**Parameters**

- **asn**
  - The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- **id**
  - The IPv4 or IPv6 address of a BGP neighbor.
- **extended**
  - Disable sending extended community attributes.
- **standard**
  - Disable sending standard community attributes.

**Modes**

- Configuration mode

**Configuration Statement**

```plaintext
protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv4-unicast {
                    disable-send-community {
                        extended
                        standard
                    }
                }
            }
        }
    }
}
```

**Usage Guidelines**

Use the `set` form of this command to disable sending community attributes between BGP neighbors.
Use the **delete** form of this command to restore sending community attributes between BGP neighbors.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast distribute-list export <acl-number>

Applies an access list to filter outbound routing updates to this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast distribute-list export acl-number
delete protocols bgp asn neighbor id address-family ipv4-unicast distribute-list export acl-number
show protocols bgp asn neighbor id address-family ipv4-unicast distribute-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
id
The IPv4 or IPv6 address of a BGP neighbor.acl-number
The number of a standard or extended access list. The range for a standard access list is 1 through 99. The range for an extended access list is 100 through 199.

Modes
Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          distribute-list {
            export acl-number
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to apply an access list to filter outbound routing updates to a BGP neighbor.
Use the delete form of this command to disable outbound distribute list filtering.
Use the show form of this command to view BGP neighbor distribute list configuration settings.

NOTE
A neighbor distribute list cannot be used together with a neighbor prefix list in the same direction. These two lists are mutually exclusive, and only one list may be applied to a given direction.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL.

The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field.

Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast distribute-list import <acl-number>

Applies an access list to filter inbound routing updates from this neighbor.

Syntax

set protocols bgp <asn> neighbor <id> address-family ipv4-unicast distribute-list import <acl-number>
delete protocols bgp <asn> neighbor <id> address-family ipv4-unicast distribute-list <acl-number>
show protocols bgp <asn> neighbor <id> address-family ipv4-unicast distribute-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
id
The IPv4 or IPv6 address of a BGP neighbor.
acl-number
The number of a standard or extended access list. The range for a standard access list is 1 through 99. The range for an extended access list is 100 through 199.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp <asn> {
  neighbor <id> {
    address-family {
      ipv4-unicast {
        distribute-list {
          import <acl-number>
        }
      }
    }
  }
}
}

Usage Guidelines

Use the set form of this command to apply an access list to filter inbound routing updates from a BGP neighbor.
Use the delete form of this command to disable inbound distribute list filtering.
Use the show form of this command to view BGP neighbor distribute list configuration settings.

NOTE
A neighbor distribute list cannot be used together with a neighbor prefix list in the same direction. These two lists are mutually exclusive, and only one list may be applied to the specified direction.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast filter-list export <as-path-list-name>

Applies an AS path list to routing updates to this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast filter-list export as-path-list-name
delete protocols bgp asn neighbor id address-family ipv4-unicast filter-list export as-path-list-name
show protocols bgp asn neighbor id address-family ipv4-unicast filter-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

as-path-list-name
Name of an AS path list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          filter-list {
            export as-path-list-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to apply an access list for filtering outbound routing updates.
Use the delete form of this command to disable outbound routing update filtering.
Use the show form of this command to view BGP neighbor filter list configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast filter-list import <as-path-list-name>

Applies an AS path list to routing updates from this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast filter-list import as-path-list-name
delete protocols bgp asn neighbor id address-family ipv4-unicast filter-list import as-path-list-name
show protocols bgp asn neighbor id address-family ipv4-unicast filter-list import

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

as-path-list-name
Name of an AS path list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          filter-list {
            import as-path-list-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to apply an access list for filtering inbound routing updates.
Use the delete form of this command to disable inbound routing update filtering.
Use the show form of this command to view BGP neighbor filter list configuration settings.
set protocols bgp asn neighbor id address-family ipv4-unicast maximum-prefix max-number [ threshold threshold-value [ warning-only ] warning-only ]

delete protocols bgp asn neighbor id address-family ipv4-unicast maximum-prefix [ threshold threshold-value [ warning-only ] warning-only ]

show protocols bgp asn neighbor id address-family ipv4-unicast maximum-prefix

**Command Default**
No maximum to the number of prefixes accepted.

**Parameters**

* asn
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

* id
  The IPv4 or IPv6 address of a BGP neighbor.

* max-number
  The maximum number of prefixes to accept from this neighbor before the neighbor is taken down.

* threshold-value
  The percentage of the maximum value of prefixes at which to start warning.

* warning-only
  Does not reset the connection once the maximum prefixes have been received. It only continues to warn.

**Modes**

Configuration mode

**Configuration Statement**

```
Usage Guidelines

Use the **set** form of this command to set the maximum number of prefixes to accept from this neighbor before the neighbor is taken down. This helps alleviate situations where the router receives more routes than it can handle.

Use the **delete** form of this command to remove the maximum prefix setting.

Use the **show** form of this command to view BGP neighbor configuration settings.

**NOTE**
You can either configure `maximum-prefix max-number [ warning-only ]` or `maximum-prefix max-number threshold threshold-value [ warning-only ]`. The two values does not coexist in a configuration.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast nexthop-self

Sets the local router as the next hop for this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast nexthop-self
delete protocols bgp asn neighbor id address-family ipv4-unicast nexthop-self
show protocols bgp asn neighbor id address-family ipv4-unicast

Command Default

Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          nexthop-self
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to set this router as the next hop for this neighbor. This disables the next-hop calculation for this neighbor.

Use the delete form of this command to restore next-hop calculation for the neighbor.

Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast peer-group <group-name>

Assigns a neighbor as a member of the specified peer group.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast peer-group group-name
delete protocols bgp asn neighbor id address-family ipv4-unicast peer-group group-name
show protocols bgp asn neighbor id address-family ipv4-unicast peer-group

Command Default

By default, peer group members inherit all configured peer group settings.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

group-name
A string identifying a BGP peer group.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          peer-group group-name
        }
      }
    }
  }
}

Usage Guidelines

Refer to Peer groups on page 25 for information about peer groups.

Use the set form of this command to assign this BGP neighbor to a peer-group.

Use the delete form of this command to remove a neighbor from a peer group.

Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast prefix-list export <list-name>

Applies a prefix list to filter updates to this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast prefix-list export list-name
delete protocols bgp asn neighbor id address-family ipv4-unicast prefix-list export list-name
show protocols bgp asn neighbor id address-family ipv4-unicast prefix-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
id
The IPv4 or IPv6 address of a BGP neighbor.
list-name
Name of a configured prefix list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          prefix-list {
            export list-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to restrict distribution of outbound BGP neighbor information by filtering with a prefix list.
Use the delete form of this command to remove an outbound prefix list filter.
Use the show form of this command to view BGP neighbor prefix list configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast prefix-list import <list-name>

Applies a prefix list to filter updates from this neighbor.

**Syntax**

```
set protocols bgp asn neighbor id address-family ipv4-unicast prefix-list import list-name
delete protocols bgp asn neighbor id address-family ipv4-unicast prefix-list import list-name
show protocols bgp asn neighbor id address-family ipv4-unicast prefix-list
```

**Parameters**

- **asn**
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- **id**
  The IPv4 or IPv6 address of a BGP neighbor.
- **list-name**
  Name of a configured prefix list.

**Modes**

Configuration mode

**Configuration Statement**

```
protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          prefix-list {
            import list-name
          }
        }
      }
    }
  }
}
```

**Usage Guidelines**

Use the `set` form of this command to restrict distribution of inbound BGP neighbor information by filtering with a prefix list.

Use the `delete` form of this command to remove an inbound prefix list filter.

Use the `show` form of this command to view BGP neighbor prefix list configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast remove-private-as

Directs the router to remove private AS numbers from updates sent to this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast remove-private-as
delete protocols bgp asn neighbor id address-family ipv4-unicast remove-private-as
show protocols bgp asn neighbor id address-family ipv4-unicast

Command Default

Private AS numbers are included in outgoing updates.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          remove-private-as
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to direct the router to exclude private AS numbers from updates to eBGP peers. When this feature is enabled, the router omits private AS numbers from the AS_PATH attribute. The private AS numbers range from 64512 through 65534.

Note that it is a configuration error to include both private and public AS numbers in an AS path. If the router detects this error, it does not remove private AS numbers.

This command may be used in confederations provided that the private AS numbers are appended after the confederation portion of the AS path.
This command applies only to eBGP peers; it cannot be used with iBGP peers.

Use the `delete` form of this command to restore the default behavior.

Use the `show` form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast route-map export <map-name>

Applies a route map to filter updates to this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast route-map export map-name
delete protocols bgp asn neighbor id address-family ipv4-unicast route-map export map-name
show protocols bgp asn neighbor id address-family ipv4-unicast route-map export

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

map-name
Name of a configured route map.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          route-map {
            export map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to restrict distribution of outbound BGP neighbor information by filtering with a route map.
Use the delete form of this command to remove an outbound route map filter.
Use the show form of this command to view BGP neighbor route map configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field.
Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast route-map import <map-name>

Applies a route map to filter updates to or from this neighbor.

Syntax

```plaintext
set protocols bgp asn neighbor id address-family ipv4-unicast route-map import map-name
delete protocols bgp asn neighbor id address-family ipv4-unicast route-map import map-name
show protocols bgp asn neighbor id address-family ipv4-unicast route-map import map-name
```

Parameters

- **asn**
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- **id**
  The IPv4 or IPv6 address of a BGP neighbor.
- **map-name**
  Name of a configured route map.

Modes

- Configuration mode

Configuration Statement

```plaintext
protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          route-map {
            import map-name
          }
        }
      }
    }
  }
}
```

Usage Guidelines

Use the `set` form of this command to restrict routing updates received from this BGP neighbor by filtering with a route map.

Use the `delete` form of this command to remove a route map filter.

Use the `show` form of this command to view BGP neighbor route map configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field.
Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast soft-reconfiguration inbound

Directs the router to store received routing updates.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast soft-reconfiguration inbound
delete protocols bgp asn neighbor id address-family ipv4-unicast soft-reconfiguration inbound
show protocols bgp asn neighbor id address-family ipv4-unicast soft-reconfiguration

Command Default

Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          soft-reconfiguration {
            inbound
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to enable soft reconfiguration.

When this command is issued, the router begins storing routing updates, which can be used subsequently for inbound soft reconfiguration. Outbound BGP soft reconfiguration can be performed without enabling inbound soft reconfiguration. This soft reconfiguration command ensures maximum utilization of memory because you request for a route-refresh from a peer and update the routing table only when there is a change in the network.

The soft-reconfiguration command helps conserve memory utilization because you request for a route-refresh from a peer and update the routing table only when there is a change in the network.
Use the **delete** form of this command to disable soft reconfiguration.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast unsuppress-map <map-name>

Directs the router to selectively advertise routes suppressed by aggregating addresses, based on a route map.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast unsuppress-map map-name
delete protocols bgp asn neighbor id address-family ipv4-unicast unsuppress-map map-name
show protocols bgp asn neighbor id address-family ipv4-unicast unsuppress-map

Command Default

Routes suppressed by address aggregation are not advertised.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

map-name
The name of a configured route map.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          unsuppress-map map-name
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to selectively advertise routes suppressed by aggregating addresses.
Use the delete form of this command to restore the default behavior.
Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv4-unicast weight <weight>

Defines a default weight for routes from this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast weight weight
delete protocols bgp asn neighbor id address-family ipv4-unicast weight weight
show protocols bgp asn neighbor id address-family ipv4-unicast weight

Command Default

Routes learned from a BGP neighbor have a weight of 0. Routes sourced by the local router have a weight of 32768.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

weight
The weight to be assigned to routes from this neighbor. The numbers range from 0 through 65535.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          weight weight
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to set the default weights for routes learned from a BGP neighbor.
Use the delete form of this command to restore routes weighting to the default. Existing route weights are not changed.
Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast

Enables the IPv6 unicast address-family for a neighbor and defines parameters for controlling IPv6 unicast routes when subsequent configuration parameters and options are present.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast
delete protocols bgp asn neighbor id address-family ipv6-unicast
show protocols bgp asn neighbor id address-family ipv6-unicast

Parameters

asn

The number of the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to enable the IPv6 unicast address-family for a neighbor and to define parameters for controlling IPv6 unicast routes when subsequent configuration parameters and options are present.

Use the delete form of this command to disable the IPv6 unicast address-family for a neighbor and to remove the configured parameters for controlling IPv6 unicast routes.

Use the show form of this command to view the configuration settings for the neighbor IPv6 unicast address-family.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast allowas-in

Allows or disallows receiving BGP advertisements containing the AS path of the local router.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast allowas-in [ number number ]
delete protocols bgp asn neighbor id address-family ipv6-unicast allowas-in
show protocols bgp asn neighbor id address-family ipv6-unicast

Command Default

Readvertisement is disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

number number

Specifies the number of times to accept an AS path containing the readvertisement of the ASN of the local router. The numbers range from 1 through 10. The default is 3.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv6-unicast {
                    allowas-in {
                        number number
                    }
                }
            }
        }
    }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to allow the router to accept BGP AS paths advertising the AS number of the router. This situation could indicate a routing loop, and by default such an update is dropped. However, you can use this command to direct the router to accept updates readvertising its AS number for a specified number of times.

Use the delete form of this command to disallow readvertisement of the AS path of the router.
Use the `show` form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast attribute-unchanged

Allows the router to send updates to a neighbor with unchanged attributes.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast attribute-unchanged [ as-path | med | next-hop ]
delete protocols bgp asn neighbor id address-family ipv6-unicast attribute-unchanged [ as-path | med | next-hop ]
show protocols bgp asn neighbor id address-family ipv6-unicast attribute-unchanged

Command Default

Disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

as-path

Propagates the route update with unchanged AS_PATH attribute.

med

Propagates the route update with unchanged Multi Exit Discriminator (MED).

next-hop

Propagates the route update with unchanged next hop.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          attribute-unchanged {
            as-path
            med
            next-hop
          }
        }
      }
    }
  }
}
Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the **set** form of this command to direct the router to propagate routing updates without modifying the BGP AS_PATH, MED, or next-hop attribute.

Use the **delete** form of this command to restore normal modification of BGP attributes.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast capability graceful-restart

Enables or disables the graceful restart capability for the specified BGP neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast capability graceful-restart [ disable ]
delete protocols bgp asn neighbor id address-family ipv6-unicast graceful-restart [ disable ]
show protocols bgp asn neighbor id address-family ipv6-unicast graceful-restart

Command Default

Disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

disable

Disables the graceful restart capability.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv4-unicast {
                    graceful-restart {
                        disable
                    }
                }
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to enable the graceful restart capability for the specified BGP neighbor.

Use the delete form of this command to disable the graceful restart capability.

Use the show form of this command to view the BGP graceful restart configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast capability orf

Advertises support for Outbound Route Filtering (ORF) for updating BGP capabilities advertised and received from this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast capability orf [ prefix-list [ receive | send ] ]
delete protocols bgp asn neighbor id address-family ipv6-unicast capability orf
show protocols bgp asn neighbor id address-family ipv6-unicast

Command Default

By default, the session is brought up with minimal capability on both sides.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

prefix-list
Advertise prefix-list ORF capability to this neighbor.

receive
Advertise the ability to receive the ORF from this neighbor.

send
Advertise the capability to send the ORF to this neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          capability {
            orf {
              prefix-list {
                receive
                send
              }
            }
          }
        }
      }
    }
  }
}
Usage Guidelines

This command specifies use of BGP ORF to send and receive capabilities. Using ORF minimizes the number of BGP updates that are sent between peer routers.

This command applies to IPv6 unicast routes only.

Use the **set** form of this command to specify BGP ORF capabilities to be used in capability negotiation.

Use the **delete** form of this command to remove the ORF capability.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast default-originate

Enables or disables forwarding of the default route to a BGP neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast default-originate [ route-map map-name ]
delete protocols bgp asn neighbor id address-family ipv6-unicast default-originate [ route-map map-name ]
show protocols bgp asn neighbor id address-family ipv6-unicast default-originate

Command Default

The default route is not distributed.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

map-name
Specifies a configured route map to be used when advertising the default route.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv6-unicast {
                    default-originate {
                        route-map map-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to enable the router to advertise the default route ::/0 to this BGP neighbor. This route can then be used by the neighbor to reach the local router if no other routes are available.

The route ::/0 need not be explicitly configured on the local router.
If a route map is specified, the default route is advertised if two conditions are satisfied:

- The route map includes a **match ip** address clause.
- A route exists that exactly matches the IP access list.

Route maps are configured using **protocols bgp <asn> neighbor <id> local-as <asn>** on page 298.

Use the `delete` form of this command to disable forwarding of the default route or to delete a route map.

Use the `show` form of this command to view BGP neighbor default route origination settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast disable-send-community <state>

Disables sending of community attributes to the specified neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast disable-send-community [ extended | standard ]
delete protocols bgp asn neighbor id address-family ipv6-unicast disable-send-community
show protocols bgp asn neighbor id address-family ipv6-unicast

Command Default

Communities are sent by default.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

extended

Disable sending extended community attributes.

standard

Disable sending standard community attributes.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          disable-send-community {
            extended
            standard
          }
        }
      }
    }
  }
}

Usage Guidelines

Use this command to enable and disable sending community attributes between BGP neighbors.
This command applies to IPv6 unicast routes only.

Use the **set** form of this command to disable sending community attributes.

Use the **delete** form of this command to restore sending community attributes.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast distribute-list export <access-list6-name>

Applies an access list to filter outbound routing updates to the specified neighbor.

Syntax

```
set protocols bgp asn neighbor id address-family ipv6-unicast distribute-list export access-list6-name
delete protocols bgp asn neighbor id address-family ipv6-unicast distribute-list export access-list6-name
show protocols bgp asn neighbor id address-family ipv6-unicast distribute-list export
```

Parameters

- **asn**
  - The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- **id**
  - The IPv4 or IPv6 address of a BGP neighbor.
- **access-list6-name**
  - The name of the IPv6 access-list.

Modes

Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          distribute-list {
            export access-list6-name
          }
        }
      }
    }
  }
}
```

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the **set** form of this command to apply an access list to filter outbound routing updates to a BGP neighbor.

Use the **delete** form of this command to disable outbound distribute list filtering.

Use the **show** form of this command to view BGP neighbor distribute list configuration settings.

**NOTE**

A neighbor distribute list cannot be used together with a neighbor prefix list in the same direction. These two lists are mutually exclusive, and only one list may be applied to a given direction.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast distribute-list import <access-list6-name>

Applies an access list to filter inbound routing updates from this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast distribute-list import access-list6-name
delete protocols bgp asn neighbor id address-family ipv6-unicast distribute-list import access-list6-name
show protocols bgp asn neighbor id address-family ipv6-unicast distribute-list import

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

access-list6-name
The name of the IPv6 access-list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          distribute-list {
            import access-list6-name
          }
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to apply an access list to filter inbound routing updates from a BGP neighbor.

Use the delete form of this command to disable inbound distribute list filtering.

Use the show form of this command to view BGP neighbor distribute list configuration settings.

NOTE
A neighbor distribute list cannot be used together with a neighbor prefix list in the same direction. These two lists are mutually exclusive, and only one list may be applied to the specified direction.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast filter-list export <as-path-list-name>

Applies a filter list to routing updates to this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast filter-list export as-path-list-name
delete protocols bgp asn neighbor id address-family ipv6-unicast filter-list export as-path-list-name
show protocols bgp asn neighbor id address-family ipv6-unicast filter-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
id
The IPv4 or IPv6 address of a BGP neighbor.
as-path-list-name
Name of an AS path list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          filter-list {
            export as-path-list-name
          }
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.
Use the set form of this command to apply an access list for filtering outbound routing updates.
Use the delete form of this command to disable outbound routing update filtering.
Use the show form of this command to view BGP neighbor filter list configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast filter-list import <as-path-list-name>

Applies a filter access list to routing updates from this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast filter-list import as-path-list-name
delete protocols bgp asn neighbor id address-family ipv6-unicast filter-list import as-path-list-name
show protocols bgp asn neighbor id address-family ipv6-unicast filter-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
id
The IPv4 or IPv6 address of a BGP neighbor.
as-path-list-name
Name of an AS path list.

Modes
Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv6-unicast {
                    filter-list {
                        import as-path-list-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.
Use the set form of this command to apply an access list for filtering inbound routing updates.
Use the delete form of this command to disable inbound routing update filtering.
Use the show form of this command to view BGP neighbor filter list configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast maximum-prefix <max-number>

Sets the maximum number of prefixes to accept from this neighbor before that neighbor is taken down.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast maximum-prefix max-number [threshold threshold-value [ warning-only ] warning-only ]
delete protocols bgp asn neighbor id address-family ipv6-unicast maximum-prefix max-number [ threshold threshold-value [ warning-only ] warning-only ]
show protocols bgp asn neighbor id address-family ipv6-unicast maximum-prefix

Command Default

No maximum to the number of prefixes accepted.

Parameters

asn
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
  The IPv4 or IPv6 address of a BGP neighbor.

max-number
  The maximum number of prefixes to accept from this neighbor before the neighbor is taken down.

threshold-value
  The percentage of the maximum value of prefixes at which to start warning.

warning-only
  Does not reset the connection once the maximum prefixes have been received. It only continues to warn.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          maximum-prefix max-number {
            threshold threshold-value {
              warning-only 
            }
            warning-only 
          }
        }
      }
    }
  }
}
Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the **set** form of this command to set the maximum number of prefixes to accept from this neighbor before the neighbor is taken down. This helps alleviate situations where the router receives more routes than it can handle.

Use the **delete** form of this command to remove the maximum prefix setting.

Use the **show** form of this command to view BGP neighbor configuration settings.

**NOTE**
You can either configure `maximum-prefix max-number [ warning-only ]` or `maximum-prefix max-number threshold threshold-value [ warning-only ]`. The two values does not coexist in a configuration.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast nexthop-self

Sets the local router as the next hop for this neighbor.

**Syntax**

- `set protocols bgp <asn> neighbor <id> address-family ipv6-unicast nexthop-self`
- `delete protocols bgp <asn> neighbor <id> address-family ipv6-unicast nexthop-self`
- `show protocols bgp <asn> neighbor <id> address-family ipv6-unicast`

**Command Default**

Disabled.

**Parameters**

- **asn**
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

- **id**
  The IPv4 or IPv6 address of a BGP neighbor.

**Modes**

Configuration mode

**Configuration Statement**

```plaintext
protocols {
  bgp <asn> {
    neighbor <id> {
      address-family {
        ipv6-unicast {
          nexthop-self
        }
      }
    }
  }
}
```

**Usage Guidelines**

- This command applies to IPv6 unicast routes only.
- Use the `set` form of this command to set this router as the next hop for this neighbor. This disables the next-hop calculation for this neighbor.
- Use the `delete` form of this command to restore next-hop calculation for the neighbor.
- Use the `show` form of this command to view BGP neighbor `ipv6-unicast` configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast peer-group <group-name>

Specifies the IPv6 peer group for this peer.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast peer-group group-name
delete protocols bgp asn neighbor id address-family ipv6-unicast peer-group group-name
show protocols bgp asn neighbor id address-family ipv6-unicast peer-group

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

group-name
Name of an IPv6 peer group for the peer to join.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          peer-group group-name
        }
      }
    }
  }
}

Usage Guidelines

This command specifies the IPv6 peer group for the peer. Refer to Peer groups on page 25 for information about peer groups.

Use the set form of this command to specify the IPv6 peer group for the peer.

Use the delete form of this command to remove the IPv6 peer group for the peer.

Use the show form of this command to view the IPv6 peer group for the peer.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast prefix-list export <prefix-list6-name>

Applies a prefix list to filter updates to this neighbor.

Syntax

set protocols bgp <asn> neighbor <id> address-family ipv6-unicast prefix-list export <prefix-list6-name>
delete protocols bgp <asn> neighbor <id> address-family ipv6-unicast prefix-list export <prefix-list6-name>
show protocols bgp <asn> neighbor <id> address-family ipv6-unicast prefix-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
id
The IPv4 or IPv6 address of a BGP neighbor.
prefix-list6-name
Name of a configured IPv6 prefix list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp as <asn> {
    neighbor <id> {
      address-family {
        ipv6-unicast {
          prefix-list {
            export <prefix-list6-name>
          }
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the **set** form of this command to restrict distribution of outbound BGP neighbor information by filtering with a prefix list.

Use the **delete** form of this command to remove an outbound prefix list filter.

Use the **show** form of this command to view BGP neighbor prefix list export configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast prefix-list import <prefix-list6-name>

Applies a prefix list to filter updates from this neighbor.

Syntax

```
set protocols bgp asn neighbor id address-family ipv6-unicast prefix-list import prefix-list6-name
```
```
delete protocols bgp asn neighbor id address-family ipv6-unicast prefix-list import prefix-list6-name
```
```
show protocols bgp asn neighbor id address-family ipv6-unicast prefix-list
```

Parameters

`asn`
The number for the AS in which this router resides. The numbers range from 1 through 4294967294. The subrange, 64512 through 65534, is reserved for private AS.

`id`
The IPv4 or IPv6 address of a BGP neighbor.

`prefix-list6-name`Name of a configured IPv6 prefix list.

Modes

Configuration mode

Configuration Statement

```
protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv6-unicast {
                    prefix-list {
                        import prefix-list6-name
                    }
                }
            }
        }
    }
}
```

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the `set` form of this command to restrict distribution of inbound BGP neighbor information by filtering with a prefix list.

Use the `delete` form of this command to remove an inbound prefix list filter.

Use the `show` form of this command to view BGP neighbor prefix list import configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast remove-private-as

Directs the router to remove private AS numbers from updates sent to this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast remove-private-as
delete protocols bgp asn neighbor id address-family ipv6-unicast remove-private-as
show protocols bgp asn neighbor id address-family ipv6-unicast

Command Default

Private AS numbers are included in outgoing updates.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          remove-private-as
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to direct the router to exclude private AS numbers from updates to eBGP peers. When this feature is enabled, the router omits private AS numbers from the AS_PATH attribute. The range of private AS numbers is 64512 through 65534.

Note that it is a configuration error to include both private and public AS numbers in an AS path. If the router detects this error, it does not remove private AS numbers.
This command may be used in confederations provided that the private AS numbers are appended after the confederation portion of the AS path.

This command applies only to eBGP peers; it cannot be used with iBGP peers.

Use the `delete` form of this command to restore the default behavior.

Use the `show` form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-map export <map-name>

Applies a route map to filter updates to this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast route-map export map-name
delete protocols bgp asn neighbor id address-family ipv6-unicast route-map export map-name
show protocols bgp asn neighbor id address-family ipv6-unicast route-map export map-name

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
id
The IPv4 or IPv6 address of a BGP neighbor.
map-name
Name of a configured route map.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv6-unicast {
                    route-map {
                        export map-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to restrict distribution of outbound BGP neighbor information by filtering with a route map.
Use the delete form of this command to remove an outbound route map filter.
Use the show form of this command to view BGP neighbor route map configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-map import <map-name>

Applies a route map to filter updates to or from this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast route-map import map-name
delete protocols bgp asn neighbor id address-family ipv6-unicast route-map import map-name
show protocols bgp asn neighbor id address-family ipv6-unicast route-map import

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

map-name
Name of a configured route map.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          route-map {
            import map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to restrict routing updates received from this BGP neighbor by filtering with a route map.

Use the delete form of this command to remove a route map filter.

Use the show form of this command to view BGP neighbor route map configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-reflector-client

Configures the specified neighbor as a route reflector client.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast route-reflector-client
delete protocols bgp asn neighbor id address-family ipv6-unicast route-reflector-client
show protocols bgp asn neighbor id address-family ipv6-unicast route-reflector-client

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          route-reflector-client
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to configure the specified neighbor as a route reflector client.
Use the delete form of this command to remove the specified neighbor as a route reflector client.
Use the show form of this command to view the route reflector client configuration for the specified neighbor.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast soft-reconfiguration inbound

Directs the router to store received routing updates.

Syntax

    set protocols bgp asn neighbor id address-family ipv6-unicast soft-reconfiguration inbound
    delete protocols bgp asn neighbor id address-family ipv6-unicast soft-reconfiguration inbound
    show protocols bgp asn neighbor id address-family ipv6-unicast

Command Default

Disabled.

Parameters

    asn

    The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

    id

    The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

    protocols {
        bgp asn {
            neighbor id {
                address-family {
                    ipv6-unicast {
                        soft-reconfiguration {
                            inbound
                        }
                    }
                }
            }
        }
    }

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to enable soft reconfiguration.

When this command is issued, the router begins storing routing updates, which can be used subsequently for inbound soft reconfiguration. Outbound BGP soft reconfiguration can be performed without enabling inbound soft reconfiguration.

The soft-reconfiguration command helps conserve memory utilization because you request for a route-refresh from a peer and update the routing table only when there is a change in the network.
Use the **delete** form of this command to disable soft reconfiguration.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast unsuppress-map <map-name>

Directs the router to selectively advertise routes suppressed by aggregating addresses, based on a route map.

Syntax

```
set protocols bgp asn neighbor id address-family ipv6-unicast unsuppress-map map-name
delete protocols bgp asn neighbor id address-family ipv6-unicast unsuppress-map map-name
show protocols bgp asn neighbor id address-family ipv6-unicast
```

Command Default

Routes suppressed by address aggregation are not advertised.

Parameters

```
asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

map-name
The name of a configured route map.
```

Modes

Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          unsuppress-map map-name
        }
      }
    }
  }
}
```

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the `set` form of this command to selectively advertise routes suppressed by aggregating addresses.

Use the `delete` form of this command to restore the default behavior.

Use the `show` form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast weight <weight>

Defines a default weight for routes from this neighbor.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast weight weight

delete protocols bgp asn neighbor id address-family ipv6-unicast weight weight

show protocols bgp asn neighbor id address-family ipv6-unicast weight

Command Default

Routes learned from a BGP neighbor have a weight of 0. Routes sourced by the local router have a weight of 32768.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

weight

The weight to be assigned to routes from this neighbor. The numbers range from 0 through 65535.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv6-unicast {
          weight weight
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to set the default weights for routes learned from a BGP neighbor.

Use the delete form of this command to restore routes weighting to the default. Existing route weights are not changed.

Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> advertisement-interval <seconds>
Sets the minimum interval for BGP route updates.

Syntax

set protocols bgp asn neighbor id advertisement-interval seconds
delete protocols bgp asn neighbor id advertisement-interval [ seconds ]
show protocols bgp asn neighbor id advertisement-interval

Command Default
The default advertisement interval is 30 seconds for eBGP peers and 5 seconds for iBGP peers.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

seconds
The minimum interval, in seconds, between BGP routing updates to this neighbor. The numbers range from 0 through 600. The default is 30 for eBGP peers and 5 for iBGP peers.

Modes
Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            advertisement-interval seconds
        }
    }
}

Usage Guidelines
Use the set form of this command to set the minimum interval between BGP routing advertisements to a BGP neighbor.
Use the delete form of this command to restore the advertisement interval to the default.
Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> capability dynamic

Advertises support for dynamic update of BGP capabilities advertised and received from this neighbor.

Syntax

set protocols bgp asn neighbor id capability dynamic
delete protocols bgp asn neighbor id capability dynamic
show protocols bgp asn neighbor id

Command Default

By default, the session is brought up with minimal capability on both sides.

Parameters

asn

Mandatory. The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

Mandatory. The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      capability {
        dynamic
      }
    }
  }
}

Usage Guidelines

In general, BGP-4 requires that if a BGP speaker receives an OPEN message with an unrecognized optional parameter, the speaker must terminate BGP peering. This makes it difficult to introduce new capabilities into the protocol. The Capabilities parameter allows graceful negotiation of BGP capabilities without requiring a peer to terminate peering.

This command specifies use of the BGP Dynamic Capability feature, which allows dynamic update of capabilities over an established BGP session.

Use the set form of this command to specify dynamic update of BGP capabilities to be used in capability negotiation.

Use the delete form of this command to remove the dynamic update capability.

Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> description <description>

Provides a brief description for a BGP neighbor.

Syntax

set protocols bgp asn neighbor id description description
delete protocols bgp asn neighbor id description [ description ]
show protocols bgp asn neighbor id description

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

description
A description of up to 80 characters for the neighbor. If spaces are included, the description must be enclosed in quotes.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      description description
    }
  }
}

Usage Guidelines

Use the set form of this command to enter a description for this BGP neighbor.
Use the delete form of this command to delete the neighbor's description.
Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> disable-capability-negotiation

Disables BGP capability negotiation.

Syntax

set protocols bgp asn neighbor id disable-capability-negotiation
delete protocols bgp asn neighbor id disable-capability-negotiation
show protocols bgp asn neighbor id

Command Default

Capability negotiation is performed.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      disable-capability-negotiation
    }
  }
}

Usage Guidelines

Use the set form of this command to disable BGP capability negotiation.
Use the delete form of this command to delete this attribute and restore BGP capability negotiation.
Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> ebgp-multihop <ttl>

Allows the configuration of eBGP neighbors not on directly connected networks.

Syntax

- set protocols bgp <asn> neighbor <id> ebgp-multihop <ttl>
- delete protocols bgp <asn> neighbor <id> ebgp-multihop <ttl>
- show protocols bgp <asn> neighbor <id>

Command Default

Only directly connected neighbors are allowed.

Parameters

- <asn>
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- <id>
  The IPv4 or IPv6 address of a BGP neighbor.
- <ttl>
  The time-to-live, or maximum number of hops allowed. The numbers range from 1 through 255.

Modes

Configuration mode

Configuration Statement

```
protocols {
  bgp <asn> {
    neighbor <id> {
      ebgp-multihop <ttl>
    }
  }
}
```

Usage Guidelines

Use this command to configure eBGP neighbors that are not on directly connected networks.

For eBGP peers, there are three possible configurations:

1. By default, outgoing TTL is set to 1 and no checking is done on TTL of incoming packets.
2. If `ebgp-multihop` is configured, the TTL for outgoing packets is set to that value and no checking is done on TTL of incoming packets.
3. If `ttl-security hops` is configured, the TTL for outgoing packets is set to 255 and the TTL of incoming packets is compared against the value set for `ttl-security hops`.

Note that `ttl-security hops` can not be configured at the same time as `ebgp-multihop`. 
Packets are dropped when TTL reaches zero.

Use the **set** form of this command to allow connections to eBGP peers residing on networks that are not directly connected.

Use the **delete** form of this command to restrict connections to directly connected peers.

Use the **show** form of this command to view BGP neighbor configuration settings.
**protocols bgp <asn> neighbor <id> enforce-multihop**

Enforces multihop for eBGP neighbors.

**Syntax**

```set protocols bgp asn neighbor id enforce-multihop```

```delete protocols bgp asn neighbor id enforce-multihop```

```show protocols bgp asn neighbor id enforce-multihop```

**Command Default**

Multihop for eBGP neighbors is not configured.

**Parameters**

- **asn**
  
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

- **id**
  
  The IPv4 or IPv6 address of a BGP neighbor.

**Modes**

Configuration mode

**Configuration Statement**

```protocols {
  bgp asn {
    neighbor id {
      enforce-multihop
    }
  }
}``` 

**Usage Guidelines**

Use the `set` form of this command to enforce multihop for eBGP neighbors residing on networks that are not directly connected.

Use the `delete` form of this command to not enforce multihop for eBGP neighbors.

Use the `show` form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> local-as <asn>

Defines a local AS number for eBGP peerings.

Syntax

set protocols bgp asn neighbor id local-as asn
delete protocols bgp asn neighbor id local-as asn
show protocols bgp asn neighbor id local-as

Parameters

asn
Mandatory if an ASN other than the parent ASN is to be sent to the neighbor. The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

Modes
Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      local-as asn
    }
  }
}

Usage Guidelines

Use the set form of this command to set a local AS number for eBGP peer groupings. This number is used by all peers in the group for peering. It cannot be applied to individual peers in the group.

A local AS number can only be applied to a true eBGP peer; it cannot be applied to peers in different subautonomous systems within a confederation.

Use the delete form of this command to remove a local AS number.

Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> med-out igp

Sets a multi-exit discriminator (MED) value that is based on changes in the Interior Gateway Protocol (IGP) metric.

Syntax

set protocols bgp asn neighbor id med-out igp
delete protocols bgp asn neighbor id med-out igp

Parameters

asn
Mandatory if an ASN other than the parent ASN is to be sent to the neighbor. The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      med-out igp
    }
  }
}

Usage Guidelines

Use the set form of this command to send a MED update that is based on the changes in IGP metric.
Use the delete form of this command to disable MED update according to changes in the IGP metric.
protocols bgp <asn> neighbor <id> med-out igp delay-updates

Delays the update of the multi-exit Discriminator (MED) to a peer.

Syntax

set protocols bgp asn neighbor id med-out igp delay-updates
delete protocols bgp asn neighbor id med-out igp delay-updates

Parameters

asn
Mandatory if an ASN other than the parent ASN is to be sent to the neighbor. The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      med-out igp delay-updates
    }
  }
}

Usage Guidelines

Use the set form of this command to delay the MED updates to a peer. Enter the command only if the device is already configured to assign the MED based on the changes in the IGP metric. The time delay is based on the default timer that is configured in protocols bgp <asn> parameters med-out-delay <minutes> on page 133.

NOTE
The device delays the MED updates when the IGP metric changes and the new metric is greater than the old IGP metric.

Use the delete form of this command to update the MED value as soon as the IGP metric changes.
protocols bgp <asn> neighbor <id> med-out minimum-igp
Sets the value of the multi-exit discriminator (MED) based on the smaller IGP metric.

Syntax
set protocols bgp asn neighbor id med-out minimum-igp
delete protocols bgp asn neighbor id med-out minimum-igp

Parameters
asn
Mandatory if an ASN other than the parent ASN is to be sent to the neighbor. The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

Modes
Configuration mode

Configuration Statement
protocols {
  bgp asn {
    neighbor id {
      med-out minimum-igp
    }
  }
}

Usage Guidelines
Use the set form of this command to set the MED value that is based on the minimum value of IGP metric. The minimum IGP metric is the smallest IGP metric received by BGP from the RIB.

NOTE
The protocols bgp <asn> neighbor <id> med-out igp and protocols bgp <asn> neighbor <id> med-out minimum-igp commands are mutually exclusive.

Use the delete form of this command to disable MED updates that is based on the IGP metric.
protocols bgp <asn> neighbor <id> override-capability

Overrides capability negotiation to allow a peering session to be established with a neighbor that does not support capability negotiation.

Syntax

- set protocols bgp asn neighbor id override-capability
- delete protocols bgp asn neighbor id override-capability
- show protocols bgp asn neighbor id

Command Default

A session cannot be established if the neighbor does not support capability negotiation.

Parameters

- **asn**
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

- **id**
  The IPv4 or IPv6 address of a BGP neighbor.

Modes

- Configuration mode

Configuration Statement

```plaintext
protocols {
  bgp asn {
    neighbor id {
      address-family {
        ipv4-unicast {
          override-capability
        }
      }
    }
  }
}
```

Usage Guidelines

Use the **set** form of this command to enable a peering session to be established with a BGP neighbor that does not support capability negotiation.

Normally, if a BGP peer does not support capability negotiation, a peering session cannot be established and the connection is terminated. Setting this value overrides this process and allows the session to be established.

Use the **delete** form of this command to restore the default behavior.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> passive

Directs the router not to initiate connections with this neighbor.

Syntax

- `set protocols bgp asn neighbor id passive`
- `delete protocols bgp asn neighbor id passive`
- `show protocols bgp asn neighbor id`

Command Default

The router both accepts inbound connections and initiates outbound connections.

Parameters

- `asn`
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- `id`
The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
    neighbor id {
      passive
    }
  }
}
```

Usage Guidelines

Use the `set` form of this command to configure the local router such that it accepts inbound connections from the neighbor, but does not initiate outbound connections by sending a BGP OPEN message.

Use the `delete` form of this command to restore the default behavior.

Use the `show` form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> password <password>

Defines a BGP MD5 password.

Syntax

set protocols bgp asn neighbor id password password
delete protocols bgp asn neighbor id password
show protocols bgp asn neighbor id password

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

password
A password to be used to generate an MD5 digest.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      password password
    }
  }
}

Usage Guidelines

Use this command to specify a password-like string for generating an MD5 authentication string. This string is used for verification by the BGP neighbor. If the MD5 digest generated by the neighbor does not match the MD5 digest generated by the local router, any communication is silently discarded by the neighbor.

Use the set form of this command to specify or modify the BGP MD5 password.

Use the delete form of this command to remove the BGP MD5 password.

Use the show form of this command to view BGP MD5 password configuration.
protocols bgp <asn> neighbor <id> port <port-number>

Specifies the source port of a BGP neighbor.

Syntax

set protocols bgp asn neighbor id port port-number
delete protocols bgp asn neighbor id port port-number
show protocols bgp asn neighbor id port

Command Default

A randomly-selected, unused port is chosen as the source port of the BGP neighbor.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

port-number

Mandatory. Specifies the source port of a BGP neighbor. The numbers range from 1 through 65535. The default is a randomly-selected, unused port.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            port port-number
        }
    }
}

Usage Guidelines

Use the set form of this command to specify the source port of a BGP neighbor.
Use the delete form of this command to restore the port to the default.
Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> remote-as <asn>

Specifies the AS number of the neighbor.

Syntax

- set protocols bgp asn neighbor id remote-as asn
- delete protocols bgp asn neighbor id remote-as asn
- show protocols bgp asn neighbor id remote-as

Parameters

- **asn**: The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- **id**: The IPv4 or IPv6 address of a BGP neighbor.

Modes

- Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
    neighbor id {
      remote-as asn
    }
  }
}
```

Usage Guidelines

Use the **set** form of this command to specify the AS number of a BGP neighbor.

If the AS number of the neighbor is the same as that of the local router, the neighbor is an internal BGP (iBGP) peer. If it is different, the neighbor is an external BGP (eBGP) peer.

Use the **delete** form of this command to remove AS number settings for the neighbor.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> shutdown

Administratively shuts down a BGP neighbor.

Syntax

set protocols bgp asn neighbor id shutdown
delete protocols bgp asn neighbor id shutdown
show protocols bgp asn neighbor id

Command Default

Disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      shutdown
    }
  }
}

Usage Guidelines

Use the set form of this command to administratively shut down a BGP neighbor.

Shutting down a BGP speaker administratively terminates any active sessions for the neighbor and removes any associated routing information. If the neighbor is a peer group, this could terminate a large number of sessions.

To determine whether a BGP neighbor has been administratively shut down, you can view BGP summary information. A neighbor with a status of Idle with a comment of Admin has been administratively shut down.

Use the delete form of this command to administratively re-enable a BGP neighbor.

Use the show form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> strict-capability-match

Directs the router to strictly match the capabilities of the neighbor.

**Syntax**

```
set protocols bgp asn neighbor id strict-capability-match
delete protocols bgp asn neighbor id strict-capability-match
show protocols bgp asn neighbor id
```

**Command Default**

Disabled.

**Parameters**

- `asn`
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

- `id`
  The IPv4 or IPv6 address of a BGP neighbor.

**Modes**

Configuration mode

**Configuration Statement**

```
protocols {
  bgp asn {
    neighbor id {
      strict-capability-match
    }
  }
}
```

**Usage Guidelines**

Use the **set** form of this command to direct the router to strictly compare the capabilities of the local router and the remote peer. If the capabilities are different, the session is terminated.

Use the **delete** form of this command to disable strict capability matching.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> timers <action>

Sets BGP timers for this neighbor.

Syntax

set protocols bgp asn neighbor id timers { connect | keepalive seconds | holdtime seconds }
delete protocols bgp asn neighbor id timers [ connect | keepalive | holdtime ]
show protocols bgp asn neighbor id timers

Command Default

The default for the connect timer is 120. The default for the keep-alive timer is 60 seconds. The default for the holdtime timer is 180 seconds.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

connect seconds
The amount of time, in seconds, that the system waits for the transport protocol connection to complete. If this timer expires, the state remains in Connect state, the timer is reset, and the system tries to initiate a new transport connection. The numbers range from 0 through 65535. The default is 120. During the connect period, the remote BGP peer can establish a connection to the local system.

connect
The BGP connect time for this BGP neighbor. The numbers are 0 and 1 through 65535, where 0 disables the connect timer.

holdtime seconds
The maximum interval, in seconds, after which if the local router has not received a keep-alive message from this neighbor, the neighbor is declared dead. The range is 0 and 4 through 65535, where 0 disables the holdtime timer. The default is 180.

keepalive seconds
The frequency, in seconds, with which the local router sends keep-alive messages to this neighbor. The numbers range from 1 through 65535. The default is 60.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            timers {
                connect seconds
            }
        }
    }
}
Usage Guidelines

Use the **set** form of this command to set timers for monitoring the health of the remote peer.

- If this command is issued and values are specified, the values configured here override global timers set for the local router.
- If this command is issued but values are not specified, the defaults for this command apply.
- If this command is not issued, or if the configuration statement is deleted, timers set globally for the router using `protocols bgp <asn> timers` on page 150 apply to this neighbor.

Use the **delete** form of this command to remove explicitly configured timers for a neighbor. In this case, timers set globally for the router apply to this neighbor.

Use the **show** form of this command to view BGP neighbor configuration settings.
protocols bgp <asn> neighbor <id> ttl-security hops <hops>
Sets Time to Live (TTL) security hop count.

Syntax

set protocols bgp asn neighbor id ttl-security hops hops
delete protocols bgp asn neighbor id ttl-security hops hops
show protocols bgp asn neighbor id ttl-security hops

Command Default
The default for the hop count is 1 for eBGP connections.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

hops
The maximum number of hops away from the local peer a peering session connection be accepted. The numbers range from 1 through 254.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      ttl-security {
        hops hops
      }
    }
  }
}

Usage Guidelines

Use this command to set the Time to Live (TTL) security for the local peer.

This option provides an additional level of security for eBGP peering sessions. It helps prevent BGP hijacking attempts by determining whether or not the BGP peer is on a directly connected network using the BGP packet TTL value.

For eBGP peers, there are three possible configurations:

1. By default, outgoing TTL is set to 1 and no checking is done on TTL of incoming packets.
2. If `ebgp-multihop` is configured, the TTL for outgoing packets is set to that value and no checking is done on TTL of incoming packets.

3. If `ttl-security hops` is configured, the TTL for outgoing packets is set to 255 and the TTL of incoming packets is compared against the value set for `ttl-security hops`.

Note that `ttl-security hops` can not be configured at the same time as `ebgp-multihop`.

Packets always be dropped when TTL reaches zero.

Use the `set` form of this command to specify the hop count.

Use the `delete` form of this command to return the system to its default.

Use the `show` form of this command to view the parameter configuration.
protocols bgp <asn> neighbor <id> update-source <source>

Specifies the source IP address or interface for routing updates.

Syntax

```
set protocols bgp asn neighbor id update-source source
delete protocols bgp asn neighbor id update-source source
show protocols bgp asn neighbor id
```

Parameters

- **asn**: The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- **id**: The IPv4 or IPv6 address of a BGP neighbor.
- **source**: The IPv4 address of the router to receive routing updates from or the interface to receive routing updates from.

Modes

- **Configuration mode**

Configuration Statement

```
protocols {
  bgp asn {
    neighbor id {
      update-source source
    }
  }
}
```

Usage Guidelines

- Use the **set** form of this command to direct the system to use a specific source for routing updates.
- Use the **delete** form of this command to remove the routing update source.
- Use the **show** form of this command to view the configuration settings.
protocols bgp <asn> neighbor <id> interface <interface-name> vrrp-failover vrrp-group <vrrp-group-id> med <med-value>

Dynamically changes the BGP best path taken for incoming traffic in accordance with the path taken by outgoing traffic, if MED is used as the control mechanism.

Syntax

set protocols bgp asn neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id med med-value
delete protocols bgp asn neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id med med-value
show protocols bgp asn neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

interface-name
The name of a BGP neighbor interface.

vrrp-group-id
The ID of a VRRP group instance.

med-value
The MED to use on a backup path.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    neighbor id {
      interface interface-name {
        vrrp-failover
        vrrp-group vrrp-group-id
        med med-value
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to dynamically change the BGP best path taken by incoming traffic in accordance with the path taken by outgoing traffic, if MED is used as the control mechanism.

Use the delete form of this command to remove the user-configured MED attribute in the BGP route update.

Use the show form of this command to view the configured MED value.
The update notification contains Multi-Exit Discriminator (MED) changes according to configuration to influence the change in BGP best paths for incoming traffic.

Master VRRP router will always send route updates with default BGP attribute values, not the one configured under “bgp neighbor vrrp-failover.”

The MED that is used on the active path or the path that includes the VRRP elected master will advertise the default MED value.

The following configuration is required to enable the notification function on vRouters:

```
set interface dataplane downlink-interface vrrp vrrp-group vrrp-group-instance-id notify bgp
```

**NOTE**
If you are upgrading the Brocade vRouter to the 4.0 release from any previous release, ensure that unique VRRP group IDs are used across interfaces to avoid conflicting configurations among those interfaces. Furthermore, by employing only the following command, use unique VRRP group IDs for the VRRP groups that are tracked by BGP.

```
protocols bgp as n neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id
```

... VRRP groups that are not tracked do not require unique IDs within the vRouter.

**NOTE**
Local route maps and policies, if any, override the MED.
protocols bgp <asn> neighbor <id> interface <interface-name> vrrp-failover vrrp-group <vrrp-group-id> prepend-as <as-path-string>

Dynamically changes the BGP best path taken by incoming traffic according to the path taken by outgoing traffic, if prepend-as string is used as the control mechanism.

Syntax

set protocols bgp asn neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id prepend-as as-path-string
delete protocols bgp asn neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id prepend-as
show protocols bgp asn neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
id
The IPv4 or IPv6 address of a BGP neighbor.
interface-name
The name of a BGP neighbor interface.
vrrp-group-id
The ID of the VRRP group instance.
as-path-string
prepend-as path string to be used on backup path.

Modes

Configuration mode

Configuration Statement

protocols {
bgp asn {
    neighbor id {
        interface interface-name {
            vrrp-failover vrrp-group vrrp-group-id {
                prepend-as as-path-string
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to direct the system to dynamically change the BGP best path taken by incoming traffic in accordance with the path taken by outgoing traffic, if prepend-as string is used as the control mechanism.

Use the delete form of this command to he user-configured prepend-as attribute in the BGP route update.
Use the **show** form of this command to view the BGP configured prepend-as value.

The update notification contains prepend-as-path changes as per configuration to influence the change in BGP best paths for incoming traffic.

The as-path-string used on the active path or the path including the VRRP elected master is NONE, that is, no AS-path prepended.

The following configuration is required to enable the notification function on vRouters:

```
set interface dataplane downlink-interface vrrp vrrp-group vrrp-group-id notify bgp
```

**NOTE**

If you are upgrading the Brocade vRouter to the 4.0 release from any previous release, ensure that unique VRRP group IDs are used across interfaces to avoid conflicting configurations among those interfaces. Furthermore, by employing only the following command, use unique VRRP group IDs for the VRRP groups that are tracked by BGP.

```
protocols bgp asn neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id
```

VRRP groups that are not tracked do not require unique IDs within the vRouter.

**NOTE**

Local route maps and policies, if any, override the prepend-as.
protocols bgp <asn> neighbor <id> interface <interface-name> vrrp-failover vrrp-group <group-id> route-map <route-map-name>

Sets route-map configuration in the Brocade vRouter for the neighbor.

Syntax

set protocols bgp <asn> neighbor <id> interface <interface-name> vrrp-failover vrrp-group <group-id> route-map <route-map-name>
delete protocols bgp <asn> neighbor <id> interface <interface-name> vrrp-failover vrrp-group <group-id> route-map <route-map-name>

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

interface-name
The name of a BGP neighbor interface.

group-id
The ID of a VRRP group instance.

route-map-name
The route map name used for a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp <asn> {
    neighbor <id> {
      interface <interface-name> {
        vrrp-failover
        vrrp-group <group-id> {
          route map <route-map-name>
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to set route map configuration to influence the path.
Use the delete form of this command to remove the route map configuration.
Use the show form of this command to view the BGP configured route-map.
NOTE

If you are upgrading the Brocade vRouter to the 4.0 release from any previous release, ensure that unique VRRP group IDs are used across interfaces to avoid conflicting configurations among those interfaces. Furthermore, by employing only the following command, use unique VRRP group IDs for the VRRP groups that are tracked by BGP.

```plaintext
protocols bgp asn neighbor id interface interface-name vrrp-failover vrrp-group vrrp-group-id
```

VRRP groups that are not tracked do not require unique IDs within the vRouter.
reset ip bgp external

Resets peering sessions for eBGP neighbors.

Syntax

reset ip bgp external [ soft [ in [ prefix-filter ] | out ] ]

Command Default

When used without the soft option, reset connections are dropped, both inbound and outbound.

Parameters

soft

Sessions are not reset. Resend updates that have changed due to an export policy change or recalculate any updates received based on import policy changes.

in

Resets BGP external peer information via soft reconfig of inbound update

prefix-filter

Resets the outbound route filter (ORF) filter.

out

Resets BGP external peer information via soft reconfig of outbound update

Modes

Operational mode

Usage Guidelines

Use this command on a router running BGP to reset sessions for external BGP (eBGP) neighbors. This forces BGP updates to be generated and new BGP policies to be applied.

Unless the soft option is used, all connections are dropped (a “hard reset”): TCP connections are terminated and all routes received from the neighbor are removed from the BGP routing table. Then the connection with the neighbor is re-established.

If the soft option is used, sessions are not reset. Changes to export policies are resent to peers. Changes to import policies causes recalculation of information in the BGP table (given that soft-reconfiguration inbound is configured on the peer).
Reset IPv4 unicast peering sessions for eBGP neighbors.

Syntax
reset ip bgp external ipv4 unicast { soft [ in [ prefix-filter ] | out ] }

Command Default
When used without the soft option, reset connections are dropped, both inbound and outbound.

Parameters
soft
Sessions are not reset. Resend updates that have changed due to an export policy change or recalculate any updates received based on import policy changes.
in
Re-read import policies and recalculate information in the BGP table based on import policy changes. This requires soft-reconfiguration inbound to be configured on the neighbor.

prefix-filter
Resets the outbound route filter (ORF) filter.

out
Re-read export policies and resend updates that have changed due to an export policy change.

Modes
Operational mode

Usage Guidelines
Use this command to reset IPv4 unicast peering sessions for eBGP neighbors. This forces BGP updates to be generated and new BGP policies to be applied.

Unless the soft option is used, all connections are dropped (a “hard reset”): TCP connections are terminated and all routes received from the neighbor are removed from the BGP routing table. Then the connection with the neighbor is re-established.

If the soft option is used, sessions are not reset. Changes to export policies are resent to peers. Changes to import policies causes recalculation of information in the BGP table (given that soft-reconfiguration inbound is configured on the peer).
reset ip bgp external ipv6 unicast <state>

Resets IPv6 unicast peering sessions for eBGP neighbors.

Syntax

reset ip bgp external ipv6 unicast { soft [ in [ prefix-filter ] | out ] }

Command Default

When used without the soft option, reset connections are dropped, both inbound and outbound.

Parameters

soft

Sessions are not reset. Resend updates that have changed due to an export policy change or recalculate any updates received based on import policy changes.

in

Re-read import policies and recalculate information in the BGP table based on import policy changes. This requires soft-reconfiguration inbound to be configured on the neighbor.

prefix-filter

Resets the outbound route filter (ORF) filter.

out

Re-read export policies and resend updates that have changed due to an export policy change.

Modes

Operational mode

Usage Guidelines

Use this command to reset IPv6 unicast peering sessions for eBGP neighbors. This forces BGP updates to be generated and new BGP policies to be applied.

Unless the soft option is used, all connections are dropped (a "hard reset"): TCP connections are terminated and all routes received from the neighbor are removed from the BGP routing table. Then the connection with the neighbor is re-established.

If the soft option is used, sessions are not reset. Changes to export policies are resent to peers. Changes to import policies causes recalculation of information in the BGP table (given that soft-reconfiguration inbound is configured on the peer).
show ip bgp ipv4 unicast neighbors
Displays IPv4 unicast route information for BGP neighbors.

Syntax
show ip bgp ipv4 unicast neighbors address

Command Default
IPv4 unicast route information is shown for all BGP neighbors.

Parameters
address
Displays BGP information for the specified IPv4 BGP neighbor. Can be in the following formats: X:XX:XX or x.xxx

Modes
Operational mode

Usage Guidelines
Use this command to display IPv4 unicast route information for BGP neighbors.
show ip bgp ipv4 unicast neighbors <id> advertised-routes

Displays advertised BGP IPv4 unicast routes for a BGP neighbor.

Syntax

```
show ip bgp ipv4 unicast neighbors id advertised-routes
```

Parameters

- **id**
  
The IPv4 or IPv6 address of a BGP neighbor.

Modes

- Operational mode

Usage Guidelines

Use this command to display advertised BGP IPv4 unicast routes for a BGP neighbor.
show ip bgp ipv4 unicast neighbors <id> received prefix-filter

Displays the IPv4 unicast prefix-lists received from a BGP neighbor.

Syntax

```
show ip bgp ipv4 unicast neighbors id received prefix-filter
```

Parameters

```
id
```

The IPv4 or IPv6 address of a BGP neighbor.

Modes

- Operational mode

Usage Guidelines

Use this command to display BGP IPv4 unicast prefix-lists received from a BGP neighbor.
show ip bgp ipv4 unicast neighbors <id> received-routes

Displays the IPv4 unicast routes received from a BGP neighbor when soft-reconfiguration inbound is enabled for the peer.

Syntax

show ip bgp ipv4 unicast neighbors /id/ received-routes

Parameters

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Operational mode

Usage Guidelines

Use this command to display IPv4 unicast routes (both accepted and rejected) received from a BGP neighbor.
show ip bgp ipv4 unicast neighbors <id> routes

Displays IPv4 unicast received and accepted routes from a BGP neighbor.

Syntax

show ip bgp ipv4 unicast neighbors <id> routes

Parameters

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Operational mode

Usage Guidelines

Use this command to display IPv4 unicast received and accepted routes from a BGP neighbor.
show ip bgp ipv6 unicast neighbors
Displays BGP neighbor information on TCP and BGP neighbor connections.

Syntax

```
show ip bgp ipv6 unicast neighbors [ipv6-address]
```

Command Default
Information is shown for all BGP neighbors.

Parameters

```
ipv6-address
The IPv6 address of a BGP neighbor.
```

Modes
Operational mode

Usage Guidelines
Use this command to display BGP neighbor information.
show ip bgp ipv6 unicast neighbors <ipv6> advertised-routes
Displays advertised routes for a BGP neighbor.

Syntax
show ip bgp ipv6 unicast neighbors ipv6 advertised-routes

Parameters
ipv6
The IPv6 address of a BGP neighbor.

Modes
Operational mode

Usage Guidelines
Use this command to display advertised routes for a BGP neighbor.
show ip bgp ipv6 unicast neighbors <ipv6> received-routes
Displays routes received from a BGP neighbor when soft-reconfiguration inbound is enabled for the peer.

Syntax

```plaintext
show ip bgp ipv6 unicast neighbors ipv6 received-routes
```

Parameters

`ipv6`

The IPv6 address of a BGP neighbor.

Modes

Operational mode

Usage Guidelines

Use this command to display routes (both accepted and rejected) received from a BGP neighbor.
show ip bgp ipv6 unicast neighbors <ipv6> routes

Displays all received and accepted routes from a BGP neighbor.

Syntax

```
show ip bgp ipv6 unicast neighbors ipv6 routes
```

Parameters

- `<ipv6>`
  
The IPv6 address of a BGP neighbor.

Modes

- Operational mode

Usage Guidelines

Use this command to display received and accepted routes from a BGP neighbor.
show ip bgp neighbors
Displays BGP neighbor information.

Syntax
show ip bgp neighbors [address]

Command Default
Information for all neighbors is displayed.

Parameters
address
Displays detailed IPv4 or IPv6 BGP information for a BGP neighbor.

Modes
Operational mode

Usage Guidelines
Use this command to display BGP neighbor information.

NOTE
This command does not display peer’s graceful-restart capability.
show ip bgp neighbors <id> advertised-routes

Displays advertised routes for a BGP neighbor.

Syntax

```plaintext
show ip bgp neighbors id advertised-routes
```

Parameters

`id`

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Operational mode

Usage Guidelines

Use this command to display advertised routes for a BGP neighbor.
show ip bgp neighbors <id> received prefix-filter
Displays prefix lists received from a BGP neighbor.

Syntax

    show ip bgp neighbors id received prefix-filter

Parameters

    id

    The IPv4 or IPv6 address of a BGP neighbor.

Modes

    Operational mode

Usage Guidelines

    Use this command to display prefix lists received from a BGP neighbor.
show ip bgp neighbors <id> received-routes

Displays routes received from a BGP neighbor when soft-reconfiguration inbound is enabled for the peer.

Syntax

show ip bgp neighbors id received-routes

Parameters

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Operational mode

Usage Guidelines

Use this command to display routes (both accepted and rejected) received from a BGP neighbor.
show ip bgp neighbors <id> routes
Displays all received and accepted routes from a BGP neighbor.

Syntax
show ip bgp neighbors id routes

Parameters
id
The IPv4 or IPv6 address of a BGP neighbor.

Modes
Operational mode

Usage Guidelines
Use this command to display received and accepted routes from a BGP neighbor.

protocols bgp <asn> peer-group <name>

Defines a BGP peer group.

Syntax

set protocols bgp asn peer-group name
delete protocols bgp asn peer-group name
show protocols bgp asn peer-group name

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
Multi-node. The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
        }
    }
}

Usage Guidelines

Configuring a peer group simplifies configuration for neighbors with similar update policies. Once a peer group is created, it can be configured using the same commands for configuring individual BGP neighbors. Each member of the peer group inherits the peer group’s update policies unless overridden by explicit configuration of the individual peer. This also makes update calculation more efficient.

All members of a peer group must share identical outbound routing policies—that is, they must have identified distribute lists, filter lists, prefix lists, and route maps applied. They need not have identical settings for default-originate, as this is always processed on a per-peer basis. Inbound update routing policies may vary per peer group member.

Use the set form of this command to define a BGP peer group.

Use the delete form of this command to remove a BGP peer group.

Use the show form of this command to view BGP peer group origination settings.
protocols bgp <asn> peer-group <name> address-family

Defines an address family for a BGP peer group.

Syntax

set protocols bgp asn peer-group name address-family
delete protocols bgp asn peer-group name address-family
show protocols bgp asn peer-group name address-family

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
Multi-node. The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to define an address family for a BGP peer group.
Use the delete form of this command to delete an address family from a BGP peer group.
Use the show form of this command to display an address family for a BGP peer group.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast

Enables the IPv4 unicast address-family for a peer group and defines parameters for controlling IPv4 unicast routes when subsequent configuration parameters and options are present.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast
delete protocols bgp asn peer-group name address-family ipv4-unicast
show protocols bgp asn peer-group name address-family ipv4-unicast

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
        }
      }
    }
  }
}

Usage Guidelines

Use the **set** form of this command to enable the IPv4 unicast address-family for a peer group and to define parameters for controlling IPv4 unicast routes when subsequent configuration parameters and options are present.

Use the **delete** form of this command to disable the IPv4 unicast address-family for a peer group and to remove the configured parameters for controlling IPv4 unicast routes.

Use the **show** form of this command to view the configuration settings for the IPv4 unicast address-family of a peer group.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast allowas-in

Allows or disallows receiving BGP advertisements containing the AS path of the local router.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast allowas-in number number
delete protocols bgp asn peer-group name address-family ipv4-unicast allowas-in [ number number ]
show protocols bgp asn peer-group name address-family ipv4-unicast

Command Default

Readvertisement is disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

number number
The number of times to accept an AS path containing the readvertisement of the ASN of the local router. The numbers range from 1 through 10. The default is 3.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          allowas-in {
            number number
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to allow the router to accept BGP AS paths advertising the AS number of the router.

This situation could indicate a routing loop, and by default such an update is dropped. However, you can use this command to direct the router to accept updates readvertising its AS number for a specified number of times.
Use the `delete` form of this command to disallow re-advertisement of the AS path of the router.

Use the `show` form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast attribute-unchanged <action>

Allows the router to send updates to a peer group with unchanged attributes.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast attribute-unchanged { as-path | med | next-hop }
delete protocols bgp asn peer-group name address-family ipv4-unicast attribute-unchanged { as-path | med | next-hop }
show protocols bgp asn peer-group name address-family ipv4-unicast attribute-unchanged

Command Default

Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

as-path
Propagates the route update with unchanged AS_PATH attribute.

med
Propagates the route update with unchanged Multi Exit Discriminator (MED).

next-hop
Propagates the route update with unchanged next hop.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          attribute-unchanged {
            as-path
            med
            next-hop
          }
        }
      }
    }
  }
}
Usage Guidelines

Use the `set` form of this command to direct the router to propagate routing updates without modifying the BGP AS_PATH, MED, or next-hop attribute.

Use the `delete` form of this command to restore normal modification of BGP attributes.

Use the `show` form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast capability graceful-restart

Enables or disables the graceful restart capability for the specified BGP peer group of an IPv4 unicast address family.

**Syntax**

- set protocols bgp asn peer-group name address-family ipv4-unicast capability graceful-restart [ disable ]
- delete protocols bgp asn peer-group name address-family ipv4-unicast capability graceful-restart [ disable ]
- show protocols bgp asn peer-group name address-family ipv4-unicast graceful-restart

**Command Default**

Disabled.

**Parameters**

- `asn`  
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- `name`  
The peer group name.
- `disable`  
Disables the graceful restart capability.

**Modes**

Configuration mode

**Configuration Statement**

```plaintext
protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          capability graceful-restart {
            disable
          }
        }
      }
    }
  }
}
```

**Usage Guidelines**

When a neighbor is a member of a peer group, graceful restart cannot be configured on the neighbor level. A graceful restart configured at the neighbor level or the peer-group level, will override the global-level graceful restart configuration.

Use the `set` form of this command to enable the graceful restart capability for the specified BGP peer group of an IPv4 unicast address family.
Use the **delete** form of this command to disable the graceful restart capability for the specified BGP peer group of an IPv4 unicast address family.

Use the **show** form of this command to display the graceful restart capability for the specified BGP peer group of an IPv4 unicast address family.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast capability orf

Advertises support for Outbound Route Filtering (ORF) for updating BGP capabilities advertised and received from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast capability orf { prefix-list [ receive | send ] }
delete protocols bgp asn peer-group name address-family ipv4-unicast capability orf { prefix-list [ receive | send ] }
show protocols bgp asn peer-group name address-family ipv4-unicast

Command Default

By default, the session is brought up with minimal capability on both sides.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

prefix-list
Advertise prefix-list ORF capability to this peer group.

receive
Advertise the ability to receive the ORF from this peer group.

send
Advertise the capability to send the ORF to this peer group.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            address-family {
                ipv4-unicast {
                    capability {
                        orf {
                            prefix-list {
                                receive
                                send
                            }
                        }
                    }
                }
            }
        }
    }
}

Peer Groups Commands
Usage Guidelines

In general, BGP-4 requires that if a BGP speaker receives an OPEN message with an unrecognized optional parameters, the speaker must terminate BGP peering. This makes it difficult to introduce new capabilities into the protocol. The Capabilities parameter allows graceful negotiation of BGP capabilities without requiring a peer to terminate peering.

This command specifies use of BGP Outbound Route Filtering (ORF) to send and receive capabilities. Using ORF minimizes the number of BGP updates that are sent between peer routers.

Use the **set** form of this command to specify BGP ORF capabilities to be used in capability negotiation.

Use the **delete** form of this command to remove the ORF capability.

Use the **show** form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast default-originate

Enables or disables forwarding of the default route to a BGP peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast default-originate [ route-map map-name ]
delete protocols bgp asn peer-group name address-family ipv4-unicast default-originate [ route-map map-name ]
show protocols bgp asn peer-group name address-family ipv4-unicast default-originate

Command Default

The default route is not distributed.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

map-name
Specifies a configured route map to be used when advertising the default route.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          default-originate {
            route-map map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to enable the router to advertise the default route 0.0.0.0 to this BGP peer group. This route can then be used by the peer group to reach the local router if no other routes are available.

The route 0.0.0.0 need not be explicitly configured on the local router.

If a route map is specified, the default route is advertised if two conditions are satisfied:
The route map includes a **match ip** address clause.

A route exists that exactly matches the IP access list.

Route maps are configured using `protocols bgp <asn> peer-group <name> local-as <asn>` on page 413.

Use the **delete** form of this command to disable forwarding of the default route or to delete a route map.

Use the **show** form of this command to view BGP peer group default route configuration settings.

**NOTE**

In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL.

The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field.

Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast disable-send-community <action>

Disables sending of community attributes to the specified peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast disable-send-community { extended | standard }
delete protocols bgp asn peer-group name address-family ipv4-unicast disable-send-community { extended | standard }
show protocols bgp asn peer-group name address-family ipv4-unicast

Command Default

Communities are sent by default.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

extended

Disable sending extended community attributes.

standard

Disable sending standard community attributes.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          disable-send-community {
            extended
            standard
          }
        }
      }
    }
  }
}

Usage Guidelines

Use this command to enable or disable the sending of community attributes between BGP peer groups.
Use the **set** form of this command to disable the sending of community attributes between peer groups.

Use the **delete** form of this command to restore sending community attributes between peer groups.

Use the **show** form of this command to view BGP peer group configuration settings between peer groups.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast distribute-list import <acl-number>

Applies an access list to filter inbound routing updates from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast distribute-list import acl-number
delete protocols bgp asn peer-group name address-family ipv4-unicast distribute-list acl-number
show protocols bgp asn peer-group name address-family ipv4-unicast distribute-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

acl-number
The number of a standard or extended access list. The number range is 1 through 99 for a standard access list, and 100 through 199 for an extended access list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          distribute-list {
            import acl-number
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to apply an access list to filter inbound routing updates from a BGP peer group.

Use the delete form of this command to disable inbound distribute list filtering.

Use the show form of this command to view BGP peer group distribute list configuration settings.

NOTE
A peer group distribute list cannot be used together with a peer group prefix list in the same direction. These two lists are mutually exclusive, and only one list may be applied to the specified direction.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL.
The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field.
Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast filter-list export <as-path-list-name>

Applies an AS path list to routing updates to this peer group.

**Syntax**

```
set protocols bgp asn peer-group name address-family ipv4-unicast filter-list export as-path-list-name
delete protocols bgp asn peer-group name address-family ipv4-unicast filter-list export [ as-path-list-name ]
show protocols bgp asn peer-group name address-family ipv4-unicast filter-list export
```

**Parameters**

`asn`

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

`name`

The peer group name.

`as-path-list-name`

Name of an autonomous system path list.

**Modes**

Configuration mode

**Configuration Statement**

```
protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          filter-list {
            export as-path-list-name
          }
        }
      }
    }
  }
}
```

**Usage Guidelines**

Use the `set` form of this command to apply an access list for filtering outbound routing updates.

Use the `delete` form of this command to disable outbound routing update filtering.

Use the `show` form of this command to view BGP peer group filter list configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast filter-list import <as-path-list-name>

Applies an AS path list to routing updates from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast filter-list import as-path-list-name
delete protocols bgp asn peer-group name address-family ipv4-unicast filter-list import [ as-path-list-name ]
show protocols bgp asn peer-group name address-family ipv4-unicast filter-list import

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

as-path-list-name
Name of an autonomous system path list.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            address-family {
                ipv4-unicast {
                    filter-list {
                        import as-path-list-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to apply an access list for filtering inbound routing updates.
Use the delete form of this command to disable inbound routing update filtering.
Use the show form of this command to view BGP peer group filter list configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast maximum-prefix <number>

Sets the maximum number of prefixes to accept from this peer group before that peer group is taken down.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast maximum-prefix max-number [threshold threshold-value [warning-only] warning-only]
delete protocols bgp asn peer-group name address-family ipv4-unicast maximum-prefix max-number [threshold threshold-value [warning-only] warning-only]
show protocols bgp asn peer-group name address-family ipv4-unicast maximum-prefix

Command Default

No maximum to the number of prefixes accepted.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

max-number
The maximum number of prefixes to accept from this peer group before the peer group is taken down.

threshold-value
The percentage of the maximum value of prefixes at which to start warning.

warning-only
Does not reset the connection once the maximum prefixes have been received. It only continues to warn.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          maximum-prefix max-number {
            threshold threshold-value {
              warning-only
            }
          } warning-only
        }
      }
    }
  }
}
Usage Guidelines

Use the set form of this command to set the maximum number of prefixes to accept from this peer group before the peer group is taken down. This helps alleviate situations where the router receives more routes than it can handle.

Use the delete form of this command to remove the maximum prefix setting.

Use the show form of this command to view BGP peer group configuration settings.

NOTE
You can either configure maximum-prefix max-number [ warning-only ] or maximum-prefix max-number threshold threshold-value [ warning-only ]. The two values does not coexist in a configuration.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast nexthop-self

Sets the local router as the next hop for this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast nexthop-self
delete protocols bgp asn peer-group name address-family ipv4-unicast nexthop-self
show protocols bgp asn peer-group name address-family ipv4-unicast

Command Default

Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          nexthop-self
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to set this router as the next hop for this peer group. This disables the next-hop calculation for this peer group.

Use the delete form of this command to restore next-hop calculation for the peer group.

Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast prefix-list export <list-name>

Applies a prefix list to filter updates to this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast prefix-list export list-name
delete protocols bgp asn peer-group name address-family ipv4-unicast prefix-list export list-name
show protocols bgp asn peer-group name address-family ipv4-unicast prefix-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

list-name
Name of a configured prefix list.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            address-family {
                ipv4-unicast {
                    prefix-list {
                        export list-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to restrict distribution of outbound BGP peer group information by filtering with a prefix list.
Use the delete form of this command to remove an outbound prefix list filter.
Use the show form of this command to view BGP peer group prefix list configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast prefix-list import <list-name>

Applies a prefix list to filter updates from this peer group.

Syntax

- set protocols bgp asn peer-group name address-family ipv4-unicast prefix-list import list-name
- delete protocols bgp asn peer-group name address-family ipv4-unicast prefix-list import list-name
- show protocols bgp asn peer-group name address-family ipv4-unicast prefix-list

Parameters

- **asn**
  - The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- **name**
  - The peer group name.
- **list-name**
  - Name of a configured prefix list.

Modes

- Configuration mode

Configuration Statement

```plaintext
protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          prefix-list {
            import list-name
          }
        }
      }
    }
  }
}
```

Usage Guidelines

- Use the `set` form of this command to restrict distribution of inbound BGP peer group information by filtering with a prefix list.
- Use the `delete` form of this command to remove an inbound prefix list filter.
- Use the `show` form of this command to view BGP peer group prefix list configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast remove-private-as

Directs the router to remove private AS numbers from updates sent to this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast remove-private-as
delete protocols bgp asn peer-group name address-family ipv4-unicast remove-private-as
show protocols bgp asn peer-group name address-family ipv4-unicast

Command Default

Private AS numbers are included in outgoing updates.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            address-family {
                ipv4-unicast {
                    remove-private-as
                }
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to direct the router to exclude private AS numbers from updates to eBGP peers. When this feature is enabled, the router omits private AS numbers from the AS_PATH attribute. The range of private AS numbers is 64512 through 65534.

Note that it is a configuration error to include both private and public AS numbers in an AS path. If the router detects this error, it does not remove private AS numbers.

This command may be used in confederations provided that the private AS numbers are appended after the confederation portion of the AS path.
This command applies only to eBGP peers; it cannot be used with iBGP peers.

Use the **delete** form of this command to restore the default behavior.

Use the **show** form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast route-map export <map-name>

Applies a route map to filter updates to this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast route-map export map-name
delete protocols bgp asn peer-group name address-family ipv4-unicast route-map export map-name
show protocols bgp asn peer-group name address-family ipv4-unicast

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

map-name
Name of a configured route map.

Modes
Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          route-map {
            export map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to restrict distribution of outbound BGP peer group information by filtering with a route map.
Use the delete form of this command to remove an outbound route map filter.
Use the show form of this command to view BGP peer group route map configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast route-map import <map-name>

Applies a route map to filter updates to or from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast route-map import map-name
delete protocols bgp asn peer-group name address-family ipv4-unicast route-map import map-name
show protocols bgp asn peer-group name address-family ipv4-unicast route-map

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

map-name
Name of a configured route map.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          route-map {
            import map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to restrict routing updates received from this BGP peer group by filtering with a route map.
Use the delete form of this command to remove a route map filter.
Use the show form of this command to view BGP peer group route map configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast soft-reconfiguration inbound

Directs the router to store received routing updates.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast soft-reconfiguration inbound
delete protocols bgp asn peer-group name address-family ipv4-unicast soft-reconfiguration inbound
show protocols bgp asn peer-group name address-family ipv4-unicast

Command Default

Disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          soft-reconfiguration {
            inbound
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to enable soft reconfiguration.

When this command is issued, the router begins storing routing updates, which can be used subsequently for inbound soft reconfiguration. Outbound BGP soft reconfiguration can be performed without enabling inbound soft reconfiguration.

The soft-reconfiguration command helps conserve memory utilization because you request for a route-refresh from a peer and update the routing table only when there is a change in the network.

Use the delete form of this command to disable soft reconfiguration.
Use the `show` form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast unsuppress-map <name>

Directs the router to selectively advertise routes suppressed by aggregating addresses, based on a route map.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast unsuppress-map map-name
delete protocols bgp asn peer-group name address-family ipv4-unicast unsuppress-map [ map-name ]
show protocols bgp asn peer-group name address-family ipv4-unicast

Command Default

Routes suppressed by address aggregation are not advertised.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

map-name
The name of a configured route map.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          peer-group name {
            unsuppress-map map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to selectively advertise routes suppressed by aggregating addresses.
Use the delete form of this command to restore the default behavior.
Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast weight <weight>

Defines a default weight for routes from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast weight weight
delete protocols bgp asn peer-group name address-family ipv4-unicast weight [ weight ]
show protocols bgp asn peer-group name address-family ipv4-unicast

Command Default

Routes learned from a BGP neighbor have a weight of 0. Routes sourced by the local router have a weight of 32768.

Parameters

asn
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
name
  The peer group name.
weight
  The weight to be assigned to routes from this peer group. The numbers range from 0 through 65535.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv4-unicast {
          weight weight
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to set the default weights for routes learned from a BGP peer group.
Use the delete form of this command to restore route weighting to the default. Existing route weights are not changed.
Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast

Enables the IPv6 unicast address-family for a peer group and defines parameters for controlling IPv6 unicast routes when subsequent configuration parameters and options are present.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast
delete protocols bgp asn peer-group name address-family ipv6-unicast
show protocols bgp asn peer-group name address-family ipv6-unicast

Parameters

asn
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
  The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to enable the IPv6 unicast address-family for a peer group and to define parameters for controlling IPv6 unicast routes when subsequent configuration parameters and options are present.

Use the delete form of this command to disable the IPv6 unicast address-family for a peer group and to remove the configured parameters for controlling IPv6 unicast routes.

Use the show form of this command to view the configuration settings for the IPv6 unicast address-family of a peer group.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast allowas-in

Allows or disallows receiving BGP advertisements containing the AS path of the local router.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast allowas-in [ number number ]
delete protocols bgp asn peer-group name address-family ipv6-unicast allowas-in
show protocols bgp asn peer-group name address-family ipv6-unicast

Command Default

Readvertisement is disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

number number
Specifies the number of times to accept an AS path containing the readvertisement of the ASN of the local router. The numbers range from 1 through 10. The default is 3.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          allowas-in {
            number number
          }
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to allow the router to accept BGP AS paths advertising the AS number of the router.
This situation could indicate a routing loop, and by default such an update is dropped. However, you can use this command to direct the router to accept updates readvertising its AS number for a specified number of times.

Use the `delete` form of this command to disallow re-advertisement of the AS path of the router.

Use the `show` form of this command to view configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast attribute-unchanged

Allows the router to send updates to a peer group with unchanged attributes.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast attribute-unchanged [ as-path | med | next-hop ]
delete protocols bgp asn peer-group name address-family ipv6-unicast attribute-unchanged [ as-path | med | next-hop ]
show protocols bgp asn peer-group name address-family ipv6-unicast attribute-unchanged

Command Default
Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

as-path
Propagates the route update with unchanged AS_PATH attribute.

med
Propagates the route update with unchanged Multi Exit Discriminator (MED).

next-hop
Propagates the route update with unchanged next hop.

Modes
Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          attribute-unchanged {
            as-path
            med
            next-hop
          }
        }
      }
    }
  }
}
Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the **set** form of this command to direct the router to propagate routing updates without modifying the BGP AS_PATH, MED, or next-hop attribute.

Use the **delete** form of this command to restore normal modification of BGP attributes.

Use the **show** form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast capability graceful-restart

Enables or disables the graceful restart capability for the specified BGP peer group of an IPv6 unicast address family.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast capability graceful-restart [ disable ]
delete protocols bgp asn peer-group name address-family ipv6-unicast graceful-restart [ disable ]
show protocols bgp asn peer-group name address-family ipv6-unicast graceful-restart

Command Default

Disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

disable

Disables the graceful restart capability.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            address-family {
                ipv6-unicast {
                    capability graceful-restart {
                        disable
                    }
                }
            }
        }
    }
}

Usage Guidelines

When a neighbor is a member of a peer group, graceful restart cannot be configured on the neighbor level. A graceful restart configured at the neighbor level or the peer-group level, will override the global-level graceful restart configuration.

Use the set form of this command to enable the graceful restart capability for the specified BGP peer group of an IPv6 unicast address family.
Use the **delete** form of this command to disable the graceful restart capability for the specified BGP peer group of an IPv6 unicast address family.

Use the **show** form of this command to display the graceful restart capability for the specified BGP peer group of an IPv6 unicast address family.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast capability orf

Advertises support for Outbound Route Filtering (ORF) for updating BGP capabilities for updating BGP capabilities advertised and received from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast capability orf { prefix-list [ receive | send ] }
delete protocols bgp asn peer-group name address-family ipv6-unicast capability orf [ prefix-list [ receive | send ] ]
show protocols bgp asn peer-group name address-family ipv6-unicast

Command Default

By default, the session is brought up with minimal capability on both sides.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

prefix-list

Advertise prefix-list ORF capability to this peer group.

receive

Advertise the ability to receive the ORF from this peer group.

send

Advertise the capability to send the ORF to this peer group.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          capability {
            orf {
              prefix-list {
                receive
                send
              }
            }
          }
        }
      }
    }
  }
}
Usage Guidelines

This command specifies use of BGP Outbound Route Filtering (ORF) to send and receive capabilities. Using ORF minimizes the number of BGP updates that are sent between peer routers.

Use the `set` form of this command to specify BGP ORF capabilities to be used in capability negotiation.

Use the `delete` form of this command to remove the ORF capability.

Use the `show` form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast capability orf prefix-list <action>

Advertises support for Outbound Route Filtering (ORF) for updating BGP capabilities advertised and received from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast capability orf prefix-list { receive | send }
delete protocols bgp asn peer-group name address-family ipv6-unicast capability orf prefix-list [ receive | send ]
show protocols bgp asn peer-group name address-family ipv6-unicast capability orf prefix-list

Command Default

By default, the session is brought up with minimal capability on both sides.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

prefix-list
Advertise prefix-list ORF capability to this peer group.

receive
Advertise the ability to receive the ORF from this peer group.

send
Advertise the capability to send the ORF to this peer group.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          capability {
            orf {
              prefix-list {
                receive
                send
              }
            }
          }
        }
      }
    }
  }
}
Usage Guidelines

This command applies to IPv6 unicast routes only.

This command specifies use of BGP Outbound Route Filtering (ORF) to send and receive capabilities. Using ORF minimizes the number of BGP updates that are sent between peer routers.

Use the set form of this command to specify BGP ORF capabilities to be used in capability negotiation.

Use the delete form of this command to remove the ORF capability.

Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast
default-originate

Enables or disables forwarding of the default route to a BGP peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast default-originate route-map map-name
delete protocols bgp asn peer-group name address-family ipv6-unicast default-originate route-map [ map-name ]
show protocols bgp asn peer-group name address-family ipv6-unicast default-originate route-map

Command Default

The default route is not distributed.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

map-name
Specifies a configured route map to be used when advertising the default route.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            address-family {
                ipv6-unicast {
                    default-originate {
                        route-map map-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to enable the router to advertise the default route ::/0 to this BGP peer group. This route can then be used by the peer group to reach the local router if no other routes are available.

The route ::/0 need not be explicitly configured on the local router.
If a route map is specified, the default route is advertised if two conditions are satisfied:

- The route map includes a `match ip` address clause.
- A route exists that exactly matches the IP access list.

Route maps are configured using `protocols bgp <asn> peer-group <name> local-as <asn>` on page 413.

Use the `delete` form of this command to disable forwarding of the default route or to delete a route map.

Use the `show` form of this command to view BGP peer group default route origination settings.

**NOTE**

In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL.

The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field.

Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast disable-send-community

Disables sending of community attributes to a specified peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast disable-send-community [ extended | standard ]
delete protocols bgp asn peer-group name address-family ipv6-unicast disable-send-community [ extended | standard ]
show protocols bgp asn peer-group name address-family ipv6-unicast

Command Default

Communities are sent by default.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

extended

Disable sending extended community attributes.

standard

Disable sending standard community attributes.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          disable-send-community {
            extended
            standard
          }
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.
Use the **set** form of this command to enable and disable sending community attributes between BGP neighbors.

Use the **delete** form of this command to restore sending community attributes.

Use the **show** form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast
distribute-list export <access-list6-name>

Applies an access list to filter outbound routing updates to this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast distribute-list export access-list6-name
delete protocols bgp asn peer-group name address-family ipv6-unicast distribute-list export [ access-list6-name ]
show protocols bgp asn peer-group name address-family ipv6-unicast distribute-list export

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

access-list6-name
The name of the IPv6 access-list.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            address-family {
                ipv6-unicast {
                    distribute-list {
                        export access-list6-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to apply an access list to filter outbound routing updates to a BGP peer group.

Use the delete form of this command to disable outbound distribute list filtering.

Use the show form of this command to view BGP peer group distribute list configuration settings.

NOTE
A peer group distribute list cannot be used together with a peer group prefix list in the same direction. These two lists are mutually exclusive, and only one list may be applied to a given direction.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast distribute-list import <access-list6-name>

Applies an access list to filter inbound routing updates from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast distribute-list import access-list6-name
delete protocols bgp asn peer-group name address-family ipv6-unicast distribute-list import [ access-list6-name ]
show protocols bgp asn peer-group name address-family ipv6-unicast distribute-list import

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
name
The peer group name.
access-list6-name
The name of the IPv6 access-list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          distribute-list {
            import access-list6-name
          }
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to apply an access list to filter inbound routing updates from a BGP peer group.
Use the delete form of this command to disable inbound distribute list filtering.
Use the show form of this command to view BGP peer group distribute list configuration settings.

NOTE
A peer group distribute list cannot be used together with a peer group prefix list in the same direction. These two lists are mutually exclusive, and only one list may be applied to the specified direction.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast filter-list export <as-path-list-name>

Applies an AS path list to routing updates to this peer group.

**Syntax**

```
set protocols bgp asn peer-group name address-family ipv6-unicast filter-list export as-path-list-name
delete protocols bgp asn peer-group name address-family ipv6-unicast filter-list export [ as-path-list-name ]
show protocols bgp asn peer-group name address-family ipv6-unicast filter-list
```

**Parameters**

*asn*

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

*name*

The peer group name.

*as-path-list-name*

Name of an autonomous system path list.

**Modes**

Configuration mode

**Configuration Statement**

```
protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          filter-list {
            export as-path-list-name
          }
        }
      }
    }
  }
}
```

**Usage Guidelines**

This command applies to IPv6 unicast routes only.

Use the **set** form of this command to apply an access list for filtering outbound routing updates.

Use the **delete** form of this command to disable outbound routing update filtering.

Use the **show** form of this command to view BGP peer group filter list configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast filter-list import <as-path-list-name>

Applies an AS path list to routing updates from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast filter-list import as-path-list-name
delete protocols bgp asn peer-group name address-family ipv6-unicast filter-list import [ as-path-list-name ]
show protocols bgp asn peer-group name address-family ipv6-unicast filter-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

as-path-list-name
Name of an autonomous system path list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          filter-list {
            import as-path-list-name
          }
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to apply an access list for filtering inbound routing updates.
Use the delete form of this command to disable inbound routing update filtering.
Use the show form of this command to view BGP peer group filter list configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast maximum-prefix <max-number>

Sets the maximum number of prefixes to accept from this peer group before that peer group is taken down.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast maximum-prefix max-number [threshold threshold-value [ warning-only ] warning-only ]
delete protocols bgp asn peer-group name address-family ipv6-unicast maximum-prefix max-number [threshold threshold-value [ warning-only ] warning-only ]
show protocols bgp asn peer-group name address-family ipv6-unicast

Command Default

No maximum to the number of prefixes accepted.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

max-number
The maximum number of prefixes to accept from this peer group before the peer group is taken down.

threshold-value
The percentage of the maximum value of prefixes at which to start warning.

warning-only
Does not reset the connection once the maximum prefixes have been received. It only continues to warn.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          maximum-prefix max-number {
            threshold threshold-value {
              warning-only
            }
            warning-only
          }
        }
      }
    }
  }
}
Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the **set** form of this command to set the maximum number of prefixes to accept from this peer group before the peer group is taken down. This helps alleviate situations where the router receives more routes than it can handle.

Use the **delete** form of this command to remove the maximum prefix setting.

Use the **show** form of this command to view BGP peer group configuration settings.

**NOTE**

You can either configure `maximum-prefix max-number [ warning-only ]` or `maximum-prefix max-number threshold threshold-value [ warning-only ]`. The two values does not coexist in a configuration.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast nexthop-self

Sets the local router as the next hop for this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast nexthop-self
delete protocols bgp asn peer-group name address-family ipv6-unicast nexthop-self
show protocols bgp asn peer-group name address-family ipv6-unicast

Command Default

Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          nexthop-self
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to set this router as the next hop for this peer group. This disables the next-hop calculation for this peer group.

Use the delete form of this command to restore next-hop calculation for the peer group.

Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast prefix-list export <name>

Applies a prefix list to filter updates to this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast prefix-list export prefix-list6-name
delete protocols bgp asn peer-group name address-family ipv6-unicast prefix-list export prefix-list6-name
show protocols bgp asn peer-group name address-family ipv6-unicast prefix-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

prefix-list6-name
Name of a configured IPv6 prefix list.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          prefix-list {
            export prefix-list6-name
          }
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to restrict distribution of outbound BGP peer group information by filtering with a prefix list.

Use the delete form of this command to remove an outbound prefix list filter.

Use the show form of this command to view BGP peer group prefix list configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast prefix-list import <prefix-list6-name>

Applies a prefix list to filter updates from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast prefix-list import prefix-list6-name
delete protocols bgp asn peer-group name address-family ipv6-unicast prefix-list import [ prefix-list6-name ]
show protocols bgp asn peer-group name address-family ipv6-unicast prefix-list

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

prefix-list6-name
Name of a configured IPv6 prefix list.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            address-family {
                ipv6-unicast {
                    prefix-list {
                        import prefix-list6-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.
Use the set form of this command to restrict distribution of inbound BGP peer group information by filtering with a prefix list.
Use the delete form of this command to remove an inbound prefix list filter.
Use the show form of this command to view BGP peer group prefix list configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast remove-private-as

Directs the router to remove private AS numbers from updates sent to this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast remove-private-as
delete protocols bgp asn peer-group name address-family ipv6-unicast remove-private-as
show protocols bgp asn peer-group name address-family ipv6-unicast

Command Default

Private AS numbers are included in outgoing updates.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          remove-private-as
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to direct the router to exclude private AS numbers from updates to eBGP peers. When this feature is enabled, the router omits private AS numbers from the AS_PATH attribute. The private AS numbers range from 64512 through 65534.

Note that it is a configuration error to include both private and public AS numbers in an AS path. If the router detects this error, it does not remove private AS numbers.
This command may be used in confederations provided that the private AS numbers are appended after the confederation portion of the AS path.

This command applies only to eBGP peers; it cannot be used with iBGP peers.

Use the **delete** form of this command to restore the default behavior.

Use the **show** form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast route-map export <map-name>

Applies a route map to filter updates to this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast route-map export map-name
delete protocols bgp asn peer-group name address-family ipv6-unicast route-map export map-name
show protocols bgp asn peer-group name address-family ipv6-unicast route-map export map-name

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

map-name
Name of a configured route map.

Modes

Configuration mode

Configuration Statement

protocols {
bgp asn {
peer-group name {
address-family {
ipv6-unicast {
route-map {
export map-name
}
}
}
}
}
}

Usage Guidelines

This command applies to IPv6 unicast routes only.
Use the set form of this command to restrict distribution of outbound BGP peer group information by filtering with a route map.
Use the delete form of this command to remove an outbound route map filter.
Use the show form of this command to view BGP peer group route map configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast route-map import <map-name>

Applies a route map to filter updates to or from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast route-map import map-name
delete protocols bgp asn peer-group name address-family ipv6-unicast route-map import [ map-name ]
show protocols bgp asn peer-group name address-family ipv6-unicast route-map import

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

map-name
Name of a configured route map.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          route-map {
            import map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to restrict routing updates received from this BGP neighbor by filtering with a route map.
Use the delete form of this command to remove a route map filter.
Use the show form of this command to view BGP peer group route map configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast soft-reconfiguration inbound

Directs the router to store received routing updates.

Syntax

set protocols bgp <asn> peer-group <name> address-family ipv6-unicast soft-reconfiguration inbound
delete protocols bgp <asn> peer-group <name> address-family ipv6-unicast soft-reconfiguration inbound
show protocols bgp <asn> peer-group <name> address-family ipv6-unicast

Command Default

Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp <asn> {
        peer-group <name> {
            address-family {
                ipv6-unicast {
                    soft-reconfiguration {
                        inbound
                    }
                }
            }
        }
    }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to enable soft reconfiguration.

When this command is issued, the router begins storing routing updates, which can be used subsequently for inbound soft reconfiguration. Outbound BGP soft reconfiguration can be performed without enabling inbound soft reconfiguration.

The soft-reconfiguration command helps conserve memory utilization because you request for a route-refresh from a peer and update the routing table only when there is a change in the network.
Use the `delete` form of this command to disable soft reconfiguration.

Use the `show` form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast unsuppress-map <map-name>

Directs the router to selectively advertise routes suppressed by aggregating addresses, based on a route map.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast unsuppress-map map-name
delete protocols bgp asn peer-group name address-family ipv6-unicast unsuppress-map map-name
show protocols bgp asn peer-group name address-family ipv6-unicast

Command Default

Routes suppressed by address aggregation are not advertised.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

map-name
The name of a configured route map.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          unsuppress-map map-name
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to selectively advertise routes suppressed by aggregating addresses.

Use the delete form of this command to restore the default behavior.

Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast weight <weight>

Defines a default weight for routes from this peer group.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast weight weight
dele protocols bgp asn peer-group name address-family ipv6-unicast [ weight ]
show protocols bgp asn peer-group name address-family ipv6-unicast

Command Default

Routes learned from a BGP neighbor have a weight of 0. Routes sourced by the local router have a weight of 32768.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

weight

The weight to be assigned to routes from this peer group. The numbers range from 0 through 65535.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          weight weight
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to set the default weights for routes learned from a BGP peer group.

Use the delete form of this command to restore route weighting to the default. Existing route weights are not changed.

Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> advertisement-interval <seconds>

Sets the minimum interval for sending BGP route updates.

Syntax

set protocols bgp asn peer-group name advertisement-interval seconds
delete protocols bgp asn peer-group name advertisement-interval [ seconds ]
show protocols bgp asn peer-group name advertisement-interval

Command Default

The default advertisement interval is 30 seconds for eBGP peers and 5 seconds for iBGP peers.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

seconds

The minimum interval, in seconds, between BGP routing updates to this neighbor. The numbers range from 0 through 600. The default is 30 for eBGP peers and 5 for iBGP peers.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      advertisement-interval seconds
    }
  }
}

Usage Guidelines

Use the set form of this command to set the minimum interval between BGP routing advertisements to a BGP peer group.

Use the delete form of this command to restore the advertisement interval to the default.

Use the show form of this command to view the configuration settings for a BGP peer group.
protocols bgp <asn> peer-group <name> capability dynamic

Advertises support for dynamic update of BGP capabilities advertised and received from this peer group.

Syntax

set protocols bgp asn peer-group name capability dynamic
delete protocols bgp asn peer-group name capability dynamic
show protocols bgp asn peer-group name

Command Default

By default, the session is brought up with minimal capability on both sides.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      capability {
        dynamic
      }
    }
  }
}

Usage Guidelines

In general, BGP-4 requires that if a BGP speaker receives an OPEN message with an unrecognized optional parameters, the speaker must terminate BGP peering. This makes it difficult to introduce new capabilities into the protocol. The Capabilities parameter allows graceful negotiation of BGP capabilities without requiring a peer to terminate peering.

This command specifies use of the BGP Dynamic Capability feature, which allows dynamic update of capabilities over an established BGP session.

Use the set form of this command to specify dynamic update of BGP capabilities to be used in capability negotiation.
Use the delete form of this command to remove the dynamic update capability.
Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> capability graceful-restart

Advertises support for dynamic update of the graceful restart of BGP capabilities advertised and received from this peer group.

Syntax

set protocols bgp asn peer-group name capability graceful-restart [ disable ]
delete protocols bgp asn peer-group name capability graceful-restart [ disable ]
show protocols bgp asn peer-group name graceful-restart

Command Default

The session is brought up with minimal capability on both sides.

Parameters

asn
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
  The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      capability {
        graceful-restart
        graceful-restart disable
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to advertise support for dynamic update of a graceful restart of BGP capabilities advertised and received from this peer group.

Use the delete form of this command to remove support for dynamic update of a graceful restart of BGP capabilities advertised and received from this peer group.

Use the show form of this command to view support for dynamic update of a graceful restart of BGP capabilities advertised and received from this peer group.
protocols bgp <asn> peer-group <name> description <description>

Provides a brief description for a BGP peer group.

Syntax

set protocols bgp asn peer-group name description description
delete protocols bgp asn peer-group name description
show protocols bgp asn peer-group name

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

description
A description of up to 80 characters for the peer group. If spaces are included, the description must be enclosed in quotes.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      description description
    }
  }
}

Usage Guidelines

Use the set form of this command to enter a description for this BGP peer group.
Use the delete form of this command to delete the peer group’s description.
Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> disable-capability-negotiation
Disables BGP capability negotiation.

Syntax
- set protocols bgp asn peer-group name disable-capability-negotiation
- delete protocols bgp asn peer-group name disable-capability-negotiation
- show protocols bgp asn peer-group name

Command Default
Capability negotiation is performed.

Parameters
- asn
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- name
  The peer group name.

Modes
Configuration mode

Configuration Statement
```bash
protocols {
  bgp asn {
    peer-group name {
      disable-capability-negotiation
    }
  }
}
```

Usage Guidelines
- Use the set form of this command to disable BGP capability negotiation.
- Use the delete form of this command to delete this attribute and restore BGP capability negotiation.
- Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> ebgp-multihop <ttl>

Allows eBGP neighbors not on directly connected networks.

Syntax

set protocols bgp asn peer-group name ebgp-multihop ttl
delete protocols bgp asn peer-group name ebgp-multihop [ ttl ]
show protocols bgp asn peer-group name ebgp-multihop

Command Default

Only directly connected neighbors are allowed.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

ttl
The time-to-live, or maximum number of hops allowed. The numbers range from 1 through 255.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      ebgp-multihop ttl
    }
  }
}

Usage Guidelines

Use the set form of this command to allow connections to eBGP peers residing on networks that are not directly connected.
Use the delete form of this command to restrict connections to directly connected peers.
Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> local-as <asn>

Defines a local autonomous system number for eBGP peerings.

Syntax

- set protocols bgp asn peer-group name local-as asn
- delete protocols bgp asn peer-group name local-as [ asn ]
- show protocols bgp asn peer-group name local-as

Parameters

- **asn**: The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- **name**: The peer group name.
- **asn**: Valid autonomous system number. This may not be the number of the autonomous system to which the peer group belongs. The numbers range from 1 through 4294967294.

Modes

Configuration mode

Configuration Statement

```plaintext
protocols {
    bgp asn {
        peer-group name {
            local-as asn
        }
    }
}
```

Usage Guidelines

Use the **set** form of this command to set a local autonomous system number for eBGP peer groupings. This number is used by all peers in the group for peering. It cannot be applied to individual peers in the group.

A local autonomous system number can only be applied to a true eBGP peer; it cannot be applied to peers in different subautonomous systems within a confederation.

Use the **delete** form of this command to remove a local autonomous system number.

Use the **show** form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> med-out igp

Sets the value of a multi-exit discriminator (MED) that is based on the Interior Gateway Protocol (IGP) metric to all peers in a peer group.

Syntax

set protocols bgp asn peer-group name med-out igp
delete protocols bgp asn peer-group name med-out igp

Parameters

asn
Mandatory if an ASN other than the parent ASN is to be sent to the neighbor. The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The name of the peer group.

Modes
Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      med-out igp
    }
  }
}

Usage Guidelines

Use the **set** form of this command to set the value of a multi-exit discriminator (MED) that is based on the Interior Gateway Protocol (IGP) metric to all peers in a peer group.

Use the **delete** form of this command to remove the MED.
protocols bgp <asn> peer-group <name> med-out igp delay-updates

Delays the update of the multi-exit discriminator (MED) to all peers in the peer-group.

Syntax

```
set protocols bgp asn peer-group name med-out igp delay-updates
delete protocols bgp asn peer-group name med-out igp delay-updates
```

Command Default

10 minutes.

Parameters

- `asn`
  Mandatory if an ASN other than the parent ASN is to be sent to the neighbor. The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

- `name`
  The peer group name.

Modes

Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
    peer-group name {
      med-out igp delay-updates
    }
  }
}
```

Usage Guidelines

Use the `set` form of this command to delay MED updates to all peers in the peer group. Enter this command if the device is already configured to assign the MED that is based on the IGP metric. The time delay is based on the default timer that is configured in `protocols bgp <asn> parameters med-out-delay <minutes>` on page 133.

**NOTE**

The device delays the MED updates if the IGP metric changes and the new metric is greater than the old IGP metric.

Use the `delete` form of this command to update the MED value as soon as the IGP metric changes.
protocols bgp <asn> peer-group <name> med-out minimum-igp

Sets the value of the multi-exit discriminator (MED) that is based on the smaller Interior Gateway Protocol (IGP) metric.

Syntax

```
set protocols bgp asn peer-group name med-out minimum-igp
delete protocols bgp asn peer-group name med-out minimum-igp
```

Parameters

- **asn**
  Mandatory if an ASN other than the parent ASN is to be sent to the neighbor. The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

- **id**
  The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

```
protocols {
  bgp asn {
    peer-group name {
      med-out minimum-igp
    }
  }
}
```

Usage Guidelines

Use the `set` form of this command to set the MED value based on the smaller IGP metric. The minimum value of IGP metric is the smallest IGP metric received by BGP from RIB.

**NOTE**

This command and `protocols bgp <asn> peer-group <name> med-out igp` on page 414 are mutually exclusive.

Use the `delete` form of this command to disable MED updates that are based on the IGP metric.
protocols bgp <asn> peer-group <name> override-capability

Overrides capability negotiation to allow a peering session to be established with a peer group that does not support capability negotiation.

Syntax

set protocols bgp asn peer-group name override-capability
delete protocols bgp asn peer-group name override-capability
show protocols bgp asn peer-group name

Command Default

A session cannot be established if the peer group does not support capability negotiation.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      override-capability
    }
  }
}

Usage Guidelines

Use the set form of this command to enable a peering session to be established with a BGP peer group that does not support capability negotiation.

Normally, if a BGP peer does not support capability negotiation, a peering session cannot be established and the connection is terminated. Setting this value overrides this process and allows the session to be established.

Use the delete form of this command to restore the default behavior.

Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> passive

Directs the router not to initiate connections with this peer group.

Syntax

set protocols bgp asn peer-group name passive
delete protocols bgp asn peer-group name passive
show protocols bgp asn peer-group name

Command Default

The router both accepts inbound connections and initiates outbound connections.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      passive
    }
  }
}

Usage Guidelines

Use the set form of this command to configure the local router such that it accepts inbound connections from the peer group, but does not initiate outbound connections by sending a BGP OPEN message.

Use the delete form of this command to restore the default behavior.

Use the show form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> password <password>

Defines a BGP MD5 password.

Syntax

set protocols bgp asn peer-group name password password
delete protocols bgp asn peer-group name password
show protocols bgp asn peer-group name password

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

pwd
A password to be used to generate an MD5 digest.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      password pwd
    }
  }
}

Usage Guidelines

Use this command to specify a password-like string for generating an MD5 authentication string. This string is used for verification by the BGP peer group. If the MD5 digest generated by the peer group does not match the MD5 digest generated by the local router, any communication is silently discarded by the peer group.

Use the set form of this command to specify or modify the BGP MD5 password.

Use the delete form of this command to remove the BGP MD5 password.

Use the show form of this command to view BGP MD5 password configuration.
protocols bgp <asn> peer-group <name> remote-as <asn>

Specifies the AS number of the peer group.

**Syntax**

- set protocols bgp asn peer-group name remote-as <asn>
- delete protocols bgp asn peer-group name remote-as [ <asn> ]
- show protocols bgp asn peer-group name remote-as

**Parameters**

- **asn**
  - The number for the AS in which this router resides. The number ranges from 1 through 4294967295.
- **name**
  - The peer group name.

**Modes**

- Configuration mode

**Configuration Statement**

```
protocols {
  bgp asn {
    peer-group name {
      remote-as <asn>
    }
  }
}
```

**Usage Guidelines**

Use the **set** form of this command to specify the AS number of a BGP peer group.

If the AS number of the peer group is the same as that of the local router, the neighbor is an internal BGP (iBGP) peer. If it is different, the neighbor is an external BGP (eBGP) peer.

Use the **delete** form of this command to remove AS number settings for the peer group.

Use the **show** form of this command to view BGP peer group configuration settings.
protocols bgp <asn> peer-group <name> shutdown

Administratively shuts down a BGP peer group.

Syntax

set protocols bgp asn peer-group name shutdown
delete protocols bgp asn peer-group name shutdown
show protocols bgp asn peer-group name

Command Default

Disabled.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            shutdown
        }
    }
}

Usage Guidelines

Use the set form of this command to administratively shut down a BGP peer group.

Shutting down a BGP speaker administratively terminates any active sessions for the peer group and removes any associated routing information. This could terminate a large number of sessions.

To determine whether a BGP neighbor has been administratively shut down, you can view BGP summary information. A neighbor with a status of Idle with a comment of Admin has been administratively shut down.

Use the delete form of this command to administratively re-enable a BGP peer group.

Use the show form of this command to view BGP peer group configuration settings.
**protocols bgp <asn> peer-group <name> strict-capability-match**

Directs the router to strictly match the capabilities of the BGP peer group.

**Syntax**

- set protocols bgp asn peer-group name strict-capability-match
- delete protocols bgp asn peer-group name strict-capability-match
- show protocols bgp asn peer-group name

**Command Default**

Disabled.

**Parameters**

*asn*

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

*id*

The IPv4 or IPv6 address of a BGP neighbor.

**Modes**

Configuration mode

**Configuration Statement**

```
protocols {
    bgp asn {
        peer-group name {
            strict-capability-match
        }
    }
}
```

**Usage Guidelines**

Use the `set` form of this command to direct the router to strictly compare the capabilities of the local router and the BGP peer. If the capabilities are different, the session is terminated.

Use the `delete` form of this command to disable strict capability matching.

Use the `show` form of this command to view the configuration settings of a BGP remove peer.
protocols bgp <asn> peer-group <name> ttl-security hops <hops>

Sets Time to Live (TTL) security hop count for this peer group.

Syntax

set protocols bgp asn peer-group name ttl-security hops hops
delete protocols bgp asn peer-group name ttl-security hops [ hops ]
show protocols bgp asn peer-group name ttl-security hops

Command Default

The default for the hop count is 254 for IBGP and 1 for EBGP connections.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name

The peer group name.

hops

The maximum number of hops away from the local peer a peering session connection be accepted. The numbers range from 1 through 254.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            ttl-security {
                hops hops
            }
        }
    }
}

Usage Guidelines

Use this command to set the Time to Live (TTL) security for the local peer group.

TTL security is incompatible with EBGP Multihops.

Use the set form of this command to specify the hop count.

Use the delete form of this command to return the system to its default.

Use the show form of this command to view the parameter configuration.
protocols bgp <asn> peer-group <name> update-source <source>

Specifies the source IP address or interface for routing updates.

Syntax

set protocols bgp asn peer-group name update-source source
delete protocols bgp asn peer-group name update-source [ source ]
show protocols bgp asn peer-group name

Parameters

asn
- The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
- The peer group name.

source
- The IPv4 address of the router to receive routing updates from or the interface to receive routing updates from.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        peer-group name {
            update-source source
        }
    }
}

Usage Guidelines

Use the set form of this command to direct the system to use a specific source for routing updates.
Use the delete form of this command to remove the routing update source.
Use the show form of this command to view the configuration settings.
reset ip bgp peer-group <name>
   Resets sessions for all members of a peer group.

Syntax
   reset ip bgp peer-group name [ soft [ in [ prefix-filter ] | out ] ]

Command Default
   When used without the soft option, reset connections are dropped, both inbound and outbound.

Parameters
   name
      The name of a defined BGP peer group.
   soft
      Sessions are not reset. Resend updates that have changed due to an export policy change or recalculate any updates received based on import policy changes.
   in
      Re-read import policies and recalculate information in the BGP table based on import policy changes. This requires soft-reconfiguration inbound to be configured on the neighbor.
   prefix-filter
      Resets the existing ORF prefix list to trigger a soft reconfiguration.
   out
      Re-read export policies and resend updates that have changed due to an export policy change.

Modes
   Operational mode

Usage Guidelines
   Use this command to reset sessions for all members of a peer group. This forces BGP updates to be generated and new BGP policies to be applied.

   Unless the soft option is used, all connections are dropped (a "hard reset"): TCP connections are terminated and all routes received from the neighbor are removed from the BGP routing table. Then the connection with the neighbor is re-established.

   If the soft option is used, routes from the neighbor are marked as stale but are not immediately removed from the BGP table. Stale routes that are not received from the neighbor when the connection is reestablished are removed from the BGP table at that point.
reset ip bgp peer-group <name> ipv4 unicast
    Resets IPv4 unicast sessions for all members of a peer group.

Syntax
    reset ip bgp peer-group <name> ipv4 unicast { soft [ in [ prefix-filter ] ] out }

Parameters
    name
        The name of a defined BGP peer group.
    soft
        Sessions are not reset. Resend updates that have changed due to an export policy change or recalculate any updates received based on import policy changes.
    in
        Re-read import policies and recalculate information in the BGP table based on import policy changes. This requires soft-reconfiguration inbound to be configured on the neighbor.
    prefix-filter
        Resets the outbound route filter (ORF) filter.
    out
        Re-read export policies and resend updates that have changed due to an export policy change.

Modes
    Operational mode

Usage Guidelines
    Use this command to reset inbound IPv4 unicast sessions for all members of a peer group. This forces BGP updates to be generated and new BGP policies to be applied.

    Unless the soft option is used, all connections are dropped (a "hard reset"): TCP connections are terminated and all routes received from the neighbor are removed from the BGP routing table. Then the connection with the neighbor is re-established.

    If the soft option is used, routes from the neighbor are marked as stale but are not immediately removed from the BGP table. Stale routes that are not received from the neighbor when the connection is reestablished are removed from the BGP table at that point.
reset ip bgp peer-group <name> ipv6 unicast

Resets IPv6 unicast sessions for all members of a peer group.

Syntax

reset ip bgp peer-group name ipv6 unicast { soft [ in [ prefix-filter ] | out ] }

Parameters

name
The name of a defined BGP peer group.

soft
Sessions are not reset. Resend updates that have changed due to an export policy change or recalculate any updates received based on import policy changes.

in
Re-read import policies and recalculate information in the BGP table based on import policy changes. This requires soft-reconfiguration inbound to be configured on the neighbor.

prefix-filter
Resets the outbound route filter (ORF) filter.

out
Re-read export policies and resend updates that have changed due to an export policy change.

Modes

Operational mode

Usage Guidelines

Use this command to reset inbound IPv6 unicast sessions for all members of a peer group. This forces BGP updates to be generated and new BGP policies to be applied.

Unless the `soft` option is used, all connections are dropped (a "hard reset"): TCP connections are terminated and all routes received from the neighbor are removed from the BGP routing table. Then the connection with the neighbor is re-established.

If the `soft` option is used, routes from the neighbor are marked as stale but are not immediately removed from the BGP table. Stale routes that are not received from the neighbor when the connection is reestablished are removed from the BGP table at that point.
Route Redistribution Commands

- protocols bgp <asn> address-family ipv4-unicast redistribute connected .......................................................... 430
- protocols bgp <asn> address-family ipv4-unicast redistribute kernel ............................................................... 432
- protocols bgp <asn> address-family ipv4-unicast redistribute ospf ................................................................. 434
- protocols bgp <asn> address-family ipv4-unicast redistribute rip ................................................................. 436
- protocols bgp <asn> address-family ipv4-unicast redistribute static .............................................................. 438
- protocols bgp <asn> address-family ipv6-unicast redistribute connected ........................................................ 440
- protocols bgp <asn> address-family ipv6-unicast redistribute kernel ............................................................... 442
- protocols bgp <asn> address-family ipv6-unicast redistribute ospfv3 ............................................................ 444
- protocols bgp <asn> address-family ipv6-unicast redistribute ripng .............................................................. 445
- protocols bgp <asn> address-family ipv6-unicast redistribute static .............................................................. 447
protocols bgp <asn> address-family ipv4-unicast redistribute connected

Redistributes directly connected routes into BGP.

Syntax

set protocols bgp asn address-family ipv4-unicast redistribute connected [ route-map map-name ]
delete protocols bgp asn address-family ipv4-unicast redistribute connected [ route-map [ map-name ] ]
show protocols bgp asn address-family ipv4-unicast redistribute connected

Command Default

When this command has not been set, directly connected routes are not distributed into BGP.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

map-name

The name of a configured route map to be used for redistributing connected routes.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv4-unicast {
        redistribute {
          connected {
            route-map map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

Use this command to redistribute directly connected routes into BGP.
Use the set form of this command to direct the router to redistribute directly connected routes into BGP.
Use the delete form of this command to prevent redistribution of directly connected routes into BGP.
Use the show form of this command to view route redistribution configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
**protocols bgp <asn> address-family ipv4-unicast redistribute kernel**

Redistributes kernel routes into BGP.

**Syntax**

- `set protocols bgp <asn> address-family ipv4-unicast redistribute kernel [ route-map map-name ]`
- `delete protocols bgp <asn> address-family ipv4-unicast redistribute kernel [ route-map [ map-name ] ]`
- `show protocols bgp <asn> address-family ipv4-unicast redistribute kernel`

**Command Default**

When this command has not been set, kernel routes are not distributed into BGP.

**Parameters**

- `asn`
  
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

- `map-name`
  
  The name of a configured route map to be used for redistributing kernel routes.

**Modes**

Configuration mode

**Configuration Statement**

```plaintext
protocols {
  bgp <asn> {
    address-family {
      ipv4-unicast {
        redistribute {
          kernel {
            route-map map-name
          }
        }
      }
    }
  }
}
```

**Usage Guidelines**

Use the `set` form of this command to direct the router to redistribute kernel routes into BGP.

Use the `delete` form of this command to prevent redistribution of kernel routes into BGP.

Use the `show` form of this command to view route redistribution configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> address-family ipv4-unicast redistribute ospf

Redistributes routes learned from Open Shortest Path First (OSPF) into BGP.

Syntax

set protocols bgp asn address-family ipv4-unicast redistribute ospf [ route-map map-name ]
delete protocols bgp asn address-family ipv4-unicast redistribute ospf [ route-map [ map-name ] ]
show protocols bgp asn address-family ipv4-unicast redistribute ospf

Command Default

When this command has not been set, routes learned from OSPF are not distributed into BGP.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

map-name

The name of a configured route map to be used for redistributing OSPF routes.

Modes

Configuration mode

Configuration Statement

protocols {
bgp asn {
address-family {
ipv4-unicast {
redistribute {
ospf {
route-map map-name
}
}
}
}
}
}

Usage Guidelines

Use the set form of this command to direct the router to redistribute routes learned from OSPF into BGP.
Use the delete form of this command to prevent redistribution of routes learned from OSPF into BGP.
Use the show form of this command to view route redistribution configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in
the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL.
The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask
for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in
the destination field.
Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for
the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> address-family ipv4-unicast redistribute rip

Redistributes routes learned from Routing Information Protocol (RIP) into BGP.

Syntax

set protocols bgp asn address-family ipv4-unicast redistribute rip [ route-map map-name ]
delete protocols bgp asn address-family ipv4-unicast redistribute rip [ route-map [ map-name ] ]
show protocols bgp asn address-family ipv4-unicast redistribute rip

Command Default

When this command has not been set, routes learned from RIP are not distributed into BGP.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

map-name
The name of a configured route map to be used for redistributing RIP routes.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv4-unicast {
        redistribute {
          rip {
            route-map map-name }
          }
        }
      }
    }
  }
}

Usage Guidelines

Use the set form of this command to direct the router to redistribute routes learned from RIP into BGP.
Use the delete form of this command to prevent redistribution of routes learned from RIP into BGP.
Use the show form of this command to view route redistribution configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> address-family ipv4-unicast redistribute static

Redistributes static routes into BGP.

Syntax

set protocols bgp asn address-family ipv4-unicast redistribute static [ route-map map-name ]
delete protocols bgp asn address-family ipv4-unicast redistribute static [ route-map map-name ]
show protocols bgp asn address-family ipv4-unicast redistribute static

Command Default

When this command has not been set, static routes are not distributed into BGP.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

map-name
The name of a configured route map to be used for redistributing static routes.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        address-family {
            ipv4-unicast {
                redistribute {
                    static {
                        route-map map-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

Use this command to redistribute static routes into BGP.
Use the set form of this command to direct the router to redistribute static routes into BGP.
Use the delete form of this command to prevent redistribution of static routes into BGP.
Use the show form of this command to view route redistribution configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in
the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL.
The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask
for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in
the destination field.
Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for
the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> address-family ipv6-unicast redistribute connected

Redistributes IPv6 unicast directly connected routes into BGP.

Syntax

set protocols bgp asn address-family ipv6-unicast redistribute connected [ route-map map-name ]
delete protocols bgp asn address-family ipv6-unicast redistribute connected [ route-map [ map-name ] ]
show protocols bgp asn address-family ipv6-unicast redistribute connected

Command Default

When this command has not been set, directly connected routes are not distributed into BGP.

Parameters

asn

The number for the autonomous system (AS) in which this router resides. The number ranges from 1 through 4294967295.

map-name

The name of a configured route map to be used for redistributing connected routes.

Modes

Configuration mode

Configuration Statement

```plaintext
protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        redistribute {
          connected {
            route-map map-name
          }
        }
      }
    }
  }
}
```

Usage Guidelines

The command applies to IPv6 unicast routes only.

Use the set form of this command to direct the router to redistribute directly connected routes into BGP.

Use the delete form of this command to prevent redistribution of directly connected routes into BGP.

Use the show form of this command to view route redistribution configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> address-family ipv6-unicast redistribute kernel
Redistributes IPv6 unicast kernel routes into BGP.

Syntax
set protocols bgp asn address-family ipv6-unicast redistribute kernel [route-map map-name]
delete protocols bgp asn address-family ipv6-unicast redistribute kernel [route-map map-name]
show protocols bgp asn address-family ipv6-unicast redistribute kernel

Command Default
When this command has not been set, kernel routes are not distributed into BGP.

Parameters
asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

map-name
The name of a configured route map to be used for redistributing kernel routes.

Modes
Configuration mode

Configuration Statement
protocols {
    bgp asn {
        address-family {
            ipv6-unicast {
                redistribute {
                    kernel {
                        route-map map-name
                    }
                }
            }
        }
    }
}

Usage Guidelines
The command applies to IPv6 unicast routes only.
Use the set form of this command to direct the router to redistribute kernel routes into BGP.
Use the delete form of this command to prevent redistribution of kernel routes into BGP.
Use the show form of this command to view route redistribution configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> address-family ipv6-unicast redistribute ospfv3

Redistributes IPv6 unicast routes learned from Open Shortest Path First Version 3 (OSPFv3) into BGP.

Syntax

set protocols bgp asn address-family ipv6-unicast redistribute ospfv3 [ route-map map-name ]
delete protocols bgp asn address-family ipv6-unicast redistribute ospfv3 [ route-map [ map-name ] ]
show protocols bgp asn address-family ipv6-unicast redistribute ospfv3

Command Default

When this command has not been set, routes learned from OSPFv3 are not distributed into BGP.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

map-name

The name of a configured route map to be used for redistributing OSPFv3 routes.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    address-family {
      ipv6-unicast {
        redistribute {
          ospfv3 {
            route-map map-name
          }
        }
      }
    }
  }
}

Usage Guidelines

The command applies to IPv6 unicast routes only.

Use the set form of this command to direct the router to redistribute routes learned from OSPFv3 into BGP.

Use the delete form of this command to prevent redistribution of routes learned from OSPFv3 into BGP.

Use the show form of this command to view route redistribution configuration settings.
protocols bgp <asn> address-family ipv6-unicast redistribute ripng
Redistributes IPv6 unicast routes learned from RIPng into BGP.

Syntax

  set protocols bgp asn address-family ipv6-unicast redistribute ripng [ route-map map-name ]
  delete protocols bgp asn address-family ipv6-unicast redistribute ripng [ route-map [ map-name ] ]
  show protocols bgp asn address-family ipv6-unicast redistribute ripng

Command Default
When this command has not been set, routes learned from RIPng are not distributed into BGP.

Parameters

  asn
  The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

  map-name
  The name of a configured route map to be used for redistributing RIPng routes.

Modes

  Configuration mode

Configuration Statement

  protocols {
    bgp asn {
      address-family {
        ipv6-unicast {
          redistribute {
            ripng {
              route-map map-name
            }
          }
        }
      }
    }
  }

Usage Guidelines

Use this command to redistribute Routing Information Protocol—next generation (RIPng) routes into BGP. The command applies to IPv6 unicast routes only.

Use the `set` form of this command to direct the router to redistribute routes learned from RIPng into BGP.

Use the `delete` form of this command to prevent redistribution of routes learned from RIPng into BGP.

Use the `show` form of this command to view route redistribution configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL.
The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field.
Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
protocols bgp <asn> address-family ipv6-unicast redistribute static

Redistributes IPv6 unicast static routes into BGP.

Syntax

set protocols bgp asn address-family ipv6-unicast redistribute static [ route-map map-name ]
delete protocols bgp asn address-family ipv6-unicast redistribute static [ route-map [ map-name ] ]
show protocols bgp asn address-family ipv6-unicast redistribute static

Command Default

When this command has not been set, static routes are not distributed into BGP.

Parameters

asn

The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

map-name

The name of a configured route map to be used for redistributing static routes.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        address-family {
            ipv6-unicast {
                redistribute {
                    static {
                        route-map map-name
                    }
                }
            }
        }
    }
}

Usage Guidelines

Use this command to redistribute static routes into BGP. The command applies to IPv6 unicast routes only.
Use the set form of this command to direct the router to redistribute static routes into BGP.
Use the delete form of this command to prevent redistribution of static routes into BGP.
Use the show form of this command to view route redistribution configuration settings.
NOTE
In the case of the IPv4 address family, if extended IPv4 ACLs are used in a route map, the route must be specified in the source field of the ACL and the net mask of the route must be specified in the destination field of the ACL. The inverse mask for the source field is applied to the prefix before the comparison with the source. The inverse mask for the destination field is applied to the net mask of the prefix before the comparison with the net mask as specified in the destination field. Effectively, the prefix must match the source with application of inverse mask of the source field. And the net mask for the prefix must match the destination with application of inverse mask of the destination field.
Route Server Commands

- protocols bgp <asn> neighbor <id> address-family ipv4-unicast route-server-client ............................................................... 450
- protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-server-client ............................................................. 451
- protocols bgp <asn> peer-group <name> address-family ipv4-unicast route-server-client ...................................................... 452
- protocols bgp <asn> peer-group <name> address-family ipv6-unicast route-server-client ...................................................... 453
protocols bgp <asn> neighbor <id> address-family ipv4-unicast route-server-client

Specifies this neighbor as a route server client.

Syntax

set protocols bgp asn neighbor id address-family ipv4-unicast route-server-client
delete protocols bgp asn neighbor id address-family ipv4-unicast route-server-client
show protocols bgp asn neighbor id address-family ipv4-unicast route-server-client

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

id
The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv4-unicast {
                    route-server-client
                }
            }
        }
    }
}

Usage Guidelines

Use the set form of this command to configure the specified neighbor as a route server client.
Use the delete form of this command to remove the specified neighbor as a route server client.
Use the show form of this command to view the route server client configuration for the specified neighbor.
protocols bgp <asn> neighbor <id> address-family ipv6-unicast route-server-client

Specify this neighbor as a route server client.

Syntax

set protocols bgp asn neighbor id address-family ipv6-unicast route-server-client
delete protocols bgp asn neighbor id address-family ipv6-unicast route-server-client
show protocols bgp asn neighbor id address-family ipv6-unicast

Command Default

Disabled.

Parameters

asn

The number for the autonomous system (AS) in which this router resides. The number ranges from 1 through 4294967295.

id

The IPv4 or IPv6 address of a BGP neighbor.

Modes

Configuration mode

Configuration Statement

protocols {
    bgp asn {
        neighbor id {
            address-family {
                ipv6-unicast {
                    route-server-client
                }
            }
        }
    }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.
Use the set form of this command to configure the BGP neighbor as a route server client.
Use the delete form of this command to remove the configuration.
Use the show form of this command to view the configuration.
protocols bgp <asn> peer-group <name> address-family ipv4-unicast route-server-client

Specify this peer group as a route server client.

Syntax

set protocols bgp asn peer-group name address-family ipv4-unicast route-server-client
delete protocols bgp asn peer-group name address-family ipv4-unicast route-server-client
show protocols bgp asn peer-group name address-family ipv4-unicast

Command Default

Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295

name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {  
  bgp asn {  
    peer-group name {  
      address-family {  
        ipv4-unicast {  
          route-server-client  
        }  
      }  
    }  
  }  
}

Usage Guidelines

Use the set form of this command to configure the BGP peer group as a route server client. Use the delete form of this command to remove the configuration. Use the show form of this command to view the configuration.
protocols bgp <asn> peer-group <name> address-family ipv6-unicast route-server-client

Specify this peer group as a route server client.

Syntax

set protocols bgp asn peer-group name address-family ipv6-unicast route-server-client
delete protocols bgp asn peer-group name address-family ipv6-unicast route-server-client
show protocols bgp asn peer-group name address-family ipv6-unicast

Command Default

Disabled.

Parameters

asn
The number for the AS in which this router resides. The number ranges from 1 through 4294967295.

name
The peer group name.

Modes

Configuration mode

Configuration Statement

protocols {
  bgp asn {
    peer-group name {
      address-family {
        ipv6-unicast {
          route-server-client
        }
      }
    }
  }
}

Usage Guidelines

This command applies to IPv6 unicast routes only.

Use the set form of this command to configure the BGP peer group as a route server client.

Use the delete form of this command to remove the configuration.

Use the show form of this command to view the configuration.
